PRIMARY CARE MANAGEMENT OF INFECTION GUIDANCE

Aims
- to provide a simple, best guess approach to the treatment of common infections
- to promote the safe, effective and economic use of antibiotics
- to minimise the emergence of bacterial resistance in the community

Principles of Treatment
1. This guidance is based on the best available evidence but its application must be modified by professional judgement.
2. Prescribe an antibiotic only when there is likely to be a clear clinical benefit
3. Avoid prescribing an antibiotic for sore throat, simple coughs and colds. Consider a no, or delayed antibiotic strategy for acute self-limiting upper respiratory tract infections.
4. Limit prescribing over the telephone to specific cases.
5. Use simple generic antibiotics first whenever possible.
6. Avoid where possible the use of broader spectrum antibiotics (e.g. co-amoxiclav, quinolones and cephalosporins) if narrow spectrum antibiotics are effective to reduce the risk of *Clostridium difficile*, MRSA and resistant UTIs.
7. Avoid widespread use of topical antibiotics (especially those agents also available as systemic preparations).
8. In pregnancy AVOID tetracyclines, aminoglycosides, quinolones and high dose metronidazole (2g). Short-term use of trimethoprim (theoretical risk in first trimester; trimethoprim is folate antagonist so avoid if low folate status or taking another folate antagonist such as an antiepileptic) or nitrofurantoin (theoretical risk of neonatal haemolysis at term) is unlikely to cause problems to the foetus.
9. Clarithromycin is preferred over erythromycin in adults as it has fewer side effects, greater compliance, and generic tablets are similar cost. In children erythromycin may be preferred as it is half the cost of clarithromycin syrup.
10. Due to the increased risk of rhabdomyolysis patients on simvastatin (any dose) should not receive concurrent treatment with clarithromycin or erythromycin. Patients on doses of atorvastatin > 20mg/day should not receive concurrent treatment with clarithromycin. Possible options are: Stop statin for duration of antibiotic course; use alternative antibiotic e.g. doxycycline; change statin to pravastatin for duration of antibiotic course. Considerations for stopping/switching the statin should include the patient’s risk factors for ischaemic heart disease and/or an acute coronary event.
11. Where a ‘best guess’ therapy has failed or special circumstances exist, microbiological advice can be obtained via the hospital switchboard (01324 566000 for Larbert)

Note: Doses are oral and for adults with normal renal function unless otherwise stated. Please refer to current edition of BNF for further information. For prescribing in children and adolescents please refer to current edition of BNF for Children.

Key
The strength of each recommendation is qualified by a letter in parenthesis

</table>
| Influenza  
HPA Influenza  
NICE guidance | Annual vaccination is essential for all those at risk of influenza. For otherwise healthy adults antivirals not recommended. Treat ‘at risk’ patients, ONLY within 48 hours of onset & when influenza is circulating in the community or in a care home where influenza is likely. **At risk:** Pregnant, 65 years or over, chronic respiratory disease (including COPD and asthma) significant cardiovascular disease (not hypertension), immunocompromised, diabetes mellitus, chronic neurological, renal or liver disease. Use **5 days treatment with oseltamivir 75 mg bd** or if there is suspected or confirmed resistance to oseltamivir or in severely immunocompromised patients use **5 days zanamivir 10 mg BD** (2 inhalations by diskhaler). For prophylaxis, see NICE. **(NICE Influenza)** Patients under 13 years see HPA Influenza link. | | |
| | | | |
| Pharyngitis / sore throat / tonsillitis  
Clinical Knowledge Summaries | Avoid **antibiotics** as 90% resolve in 7 days without, and pain only reduced by 16 hours\(^A\)+  
If Centor score 3 or 4: (Lymphadenopathy; No Cough; Fever; Tonsillar Exudate)\(^A\) consider 2 or 3-day delayed or immediate antibiotics\(^A\)+  
For treatment of Group A strep – see below  
Antibiotics to prevent Quinsy (NNT >4000\(^B\)), Antibiotics to prevent Otitis media (NNT 200\(^A\))  
**QDS phenoxymethylpenicillin may be more appropriate if severe.\(^D\)**  | **Phenoxyemethylpenicillin**  
500 mg QDS or 1000mg BD  
*if allergy to penicillin* Clarithromycin  
(check sensitivities once available)  
250 - 500 mg BD | 10 days |
| | | | |
| Acute Otitis media - child  
Clinical Knowledge Summaries | Optimise **analgesia** and target antibiotics\(^B\)  
- Use NSAID or paracetamol.\(^A\)  
- **Avoid antibiotics** as 60% are better in 24 hours without: they only reduce pain at 2 days (NNT15) **and do not prevent deafness**\(^A\)+  
- Many are viral  
Consider 2 or 3-day delayed\(^A\)+ or immediate antibiotics for pain relief if:  
  - < 2yrs with bilateral AOM (NNT4\(^A\)+)  
  - All ages with otorrhoea (NNT3\(^A\)+)  
  (Abx to prevent Mastoiditis (NNT >4000 \(^B\)))  
(Haemophilus is an extracellular pathogen, thus macrolides, which concentrate intracellularly, are less effective treatment.)  
**Child doses**  
1st line  
**Amoxicillin**  
40mg/kg/day in 3 divided doses. Maximum 1g TDS  
or  
*if allergy to penicillin* Erythromycin  
<2 yrs  125 mg QDS  
2-8 yrs  250 mg QDS  
Other:  250-500 mg QDS  
(Check sensitivities once available)  | 5 days\(^A\)+  
5 days\(^A\)+  |
| Acute Otitis Externa  
Clinical Knowledge Summaries | First use aural toilet (if available) & analgesia  
Cure rates similar at 7 days for topical acetic acid or antibiotic +/-steroid\(^A\)+  
If cellulitis or disease extending outside ear canal, start oral antibiotics and refer \(^A\)+  | **First Line:**  
acetic acid 2% - 1 spray TDS  
**Second Line:** neomycin sulphate with corticosteroid\(^A\),\(^D\) 3 drops TDS | 7 days  
7 days min to 14 days max\(^A\)+  |
### Acute rhinosinusitis

**Clinical Knowledge Summaries**

**Avoid antibiotics**
- 80% resolve in 14 days without, and they only offer marginal benefit after 7 days (NNT15 A+).

**Use adequate analgesia**
- Consider 7-day delayed or immediate antibiotic when purulent nasal discharge (NNT8 A+)
- For child doses refer to BNF for children. Avoid tetracyclines in children < 12 years, use erythromycin.

**In persistent infection use an agent with anti-anaerobic activity eg. co-amoxiclav**
- For treatment failure in children refer to microbiologist for advice – avoid quinolones.

**1st line**
- Amoxicillin A+ 500 mg TDS (1G TDS if severe)
- or Phenoxymethylpenicillin B+ 500mg QDS
- if allergy to penicillin
  - Doxycycline 200 mg stat followed by 100mg OD

**DURATION OF Tx**
- 7 days

**Lower Respiratory Tract Infections**

**Note:** Avoid tetracyclines in pregnancy. Low doses of penicillins are more likely to select out resistance. Ciprofloxacin and ofloxacin have poor activity against pneumococci and should not be used first line unless PROVEN Psuedomonal infection. Obtain sputum for culture if possible but do not delay starting treatment. Penicillin allergic patients on simvastatin or atorvastatin (>20mg) should have doxycycline rather than clarithromycin due to risk of drug interaction.

**Community-acquired pneumonia - treatment in the community**

**BTS guidelines 2009**

**Start antibiotics immediately**
- In severely ill antibiotics before admission.
- If no response in 48 hours consider admission or add a second antibiotic (clarithromycin or a tetracycline) to cover mycoplasma infection (rare in >65 years).
- If no improvement and/or penicillin allergy discuss options with microbiology.
- *If no response to antibiotics after 2 weeks and/or if severely ill consider possibility of lung cancer or tuberculosis and arrange chest X-ray. Seek risk factors for Staph aureus and Legionella.

**1st line**
- amoxicillin A+ 500mg – 1000mg TDS
  - OR if allergy to penicillin
    - doxycycline A 200mg day 1 then 100mg OD
    - OR clarithromycin A  500mg BD

**DURATION**
- 7 - 10 days

**Acute exacerbation of COPD**

**NICE guidance GOLD**

**Risk factors for antibiotic resistant organisms include; co-morbid disease, severe COPD, frequent exacerbations, antibiotics in last 3 months**

**1st line**
- Amoxicillin 500mg TDS
  - if allergy to penicillin
    - Doxycycline 200mg day 1 then 100mg OD
    - or Clarithromycin 500mg BD

**DURATION**
- 5 days

**If risk factors for resistance or failure of first line treatment**
- Co-amoxiclav 625mg TDS
**If penicillin allergic, discuss with microbiology**

**DURATION**
- 5 days

| Cellulitis | If patient afebrile and healthy other than cellulitis, flucloxacillin may be used as a single drug treatment. If river or sea water exposure discuss with microbiologist If febrile and ill admit for IV treatment | **Facial cellulitis** | **Flucloxacillin 500mg QDS**  
In penicillin allergy  
Clarithromycin alone 500mg BD  
or  
Clindamycin (caution in elderly due to ADR’s) 300-450mg QDS (if diarrhoea – stop)  
Co-amoxiclav 625mg TDS  
For MRSA positive patients – discuss with microbiology | All for 7 days. If slow response, continue for further 7 days |
| Cellulitis associated with lymphoedema | See Strathcarron Hospice guidance | | |
| MRSA | Use antibiotics sensitivities to guide treatment. If severe infection seek advice from microbiology. | Avoid monotherapy with oral agents | |
| PVL S. aureus <HPA.org> | Panton-Valentine Leukocidin (PVL) is a toxin produced by 2% of Staphylococcus aureus (both MSSA and MRSA) and is associated with persistent recurrent pustules and carbuncles or cellulitis. Send swabs for culture in these clinical scenarios. On rare occasions it causes more severe invasive infections, even in otherwise fit people. Risk factors include: contact sports, sharing equipment, poor hygiene and eczema | | |
| Mastitis | | | |
| Conjunctivitis  
[Clinical Knowledge Summaries](#) | Most bacterial infections are self-limiting. 65% resolve on placebo by day 5. They are usually unilateral with yellow-white mucopurulent discharge. Fusidic acid has no Gram-negative activity or streptococcal activity Gentamicin has no streptococcal cover | **Chloramphenicol 0.5% drops - 1 drop 2 hrly reducing to QDS PLUS 1% ointment at night PLUS**  
**Second line:**  
Fusidic acid 1% gel – Apply BD  
or Gentamicin 0.3% eye drops 2 hrly reducing to QDS | Continue all for 48 hours after resolution |

<tr>
<td><strong>Dermatophyte infection of the proximal fingernail or toenail</strong> - for children seek advice</td>
<td>Take nail clippings: Start therapy only if infection is confirmed by laboratory. Idiosyncratic liver reactions occur rarely with terbinafine. It is more effective than the azoles. For infections with yeast and non-dermatophyte mould use itraconazole^c^ (can also be used for some dermatophytes)</td>
<td><strong>Superficial only</strong>  5% Amorolfine nail lacquer^b^ (for superficial) – 1-2 x a week Terbinafine^a^: 250mg daily Itraconazole 200 mg BD for 7 days monthly</td>
<td>6 months for fingers 12 months for toes 6 – 12 weeks for fingers 3 – 6 months for toes</td>
</tr>
<tr>
<td><strong>Acne Vulgaris</strong></td>
<td>Consider topical antibiotics after topical benzoyl peroxide or azeleic acid. Use alone or in combination with benzoyl peroxide, retinoids or zinc. Other antimicrobials may be beneficial if topical treatments fail. Do not routinely use topical and oral. (Use of Isotrexin gel with oral erythromycin is an option)</td>
<td><strong>Topical</strong>  Clindamycin or Erythromycin – apply BD Or Oral Erythromycin 500mg BD Or Doxycycline 100mg OD Or Oxytetracycline 500mg BD Or Lymecycline 408mg OD</td>
<td>Treat for at least 6 months Assess effect after 3 months. Continue for at least 6 months if effective</td>
</tr>
<tr>
<td><strong>Varicella zoster/Chicken pox &amp; Herpes zoster/Shingles</strong></td>
<td>If pregnant/immunocompromised/ neonate seek urgent advice re treatment and prophylaxis. <strong>Chicken pox</strong>: Clinical value of antivirals minimal unless &gt;14 years, immunocompromised, severe pain or dense/oral rash, on steroids,smoker, or secondary household case AND treatment started &lt;24h of onset of rash.** Shingles**: Always treat if active ophthalmic or Ramsey Hunt or eczema. <strong>Non-ophthalmic</strong>: Treat &gt; 50years** if &lt; 72 h of onset of rash, as post-herpetic neuralgia rare in &lt; 50yrs but occurs in 20%&gt;50yr**</td>
<td><strong>1st line</strong> – Aciclovir 800mg 5 x day  <strong>2nd line for shingles or if compliance a problem</strong> – Famciclovir 250mg TDS Or Valaciclovir 1g TDS Child doses – see BNF for children</td>
<td>7 days 7 days 7 days</td>
</tr>
</tbody>
</table>

---

^a^ Other anti-fungal therapy may be considered if infection recurs or is severe

^b^ Topical - if superficial infection

^c^ Can also be used for some dermatophytes

---

Clinical Knowledge Summaries
This guidance is not designed to be a definitive guide to oral conditions. It is for GPs for the management of acute oral conditions pending being seen by a dentist or dental specialist. GPs should not routinely be involved in dental treatment and, if possible, advice should be sought from the patient’s dentist, who should have an answer-phone message with details of how to access treatment out-of-hours.

| Mucosal ulceration and inflammation (simple gingivitis) | • Temporary pain and swelling relief can be attained with saline mouthwash  
• Use antiseptic mouthwash:  
• If more severe & pain limits oral hygiene to treat or prevent secondary infection.  
• The primary cause for mucosal ulceration or inflammation (aphthous ulcers, oral lichen planus, herpes simplex infection, oral cancer) needs to be evaluated and treated. | Simple saline mouthwash – ½ teaspoon salt dissolved in glass warm water  
Chlorhexidine 0.12-0.2% *(Do not use within 30 mins of toothpaste)* – Rinse mouth for 1 minute BD with 5ml diluted in 5-10ml water  
Hydrogen peroxide 6% *(spit out after use)* – Rinse mouth for about 2 minutes TDS with 15ml diluted in ½ glass warm water | Always spit out after use  
Use until lesions resolve or less pain allow oral hygiene |
| Acute necrotising ulcerative gingivitis | Commence metronidazole and refer to dentist for scaling and oral hygiene advice  
Use in combination with antiseptic mouthwash if pain limits oral hygiene | Metronidazole 400mg TDS  
Chlorhexidine or hydrogen peroxide - as above | 3 days  
Until oral hygiene possible |
| Dental abscess               | • Regular analgesia should be first option until a dentist can be seen for urgent drainage, as repeated courses of antibiotics for abscess are not appropriate; Repeated antibiotics alone, without drainage are ineffective in preventing spread of infection.  
• Antibiotics are recommended if there are signs of severe infection, systemic symptoms or high risk of complications.  
• Severe odontogenic infections; defined as cellulitis plus signs of sepsis, difficulty in swallowing, impending airway obstruction, Ludwigs angina. Refer urgently for admission to protect airway, achieve surgical drainage and IV antibiotics  
The empirical use of cephalosporins, co-amoxiclav, clarithromycin, and clindamycin do not offer any advantage for most dental patients and should only be used if no response to first line drugs when referral is the preferred option. | Amoxicillin – 500mg TDS  
or Phenoxymethylpenicillin - 500mg-1g QDS  
*True penicillin allergy:* Clarithromycin 500mg BD  
*Severe infection add* Metronidazole 400mg TDS  
*if allergy* Clindamycin 300mg QDS | Up to 5 days – review at 3 days  
5 days  
5 days |
| Pericoronitis                | Refer to dentist for irrigation & debridement.  
If persistent swelling or systemic symptoms use metronidazole.  
Use antiseptic mouthwash if pain and trismus limit oral hygiene | Amoxicillin 500mg TDS  
Metronidazole 400mg TDS  
Chlorhexidine or hydrogen peroxide - dose as above | 3 days  
3 days  
Until oral hygiene possible |

**Note:** Central Sexual Health line: 01786 433697 Central Sexual Health professional and patient helpline: 01324 613944 Mon-Fri 0900-1215
Can refer via scigateway  Central Sexual Health Secretary: 01324 673555  Website: [www.centralsexualhealth.org](http://www.centralsexualhealth.org)
British association for sexual health: [www.bashh.org](http://www.bashh.org)

**Syphilis**  
Refer all patients with positive blood tests indicating “syphilis” to GUM, Central Sexual Health by the helpline number above without treatment.

**Gonorrhoea**  
Refer all patients with positive NAATs and/or cultures to GUM, Central Sexual Health via the helpline. Patients should attend GUM for management, culture for antibiotic sensitivity, partner notification and follow-up. First line therapy is intramuscular ceftriaxone 500mg stat together with azithromycin 1g stat.

**Vaginal candidiasis**  
Exclude genital Herpes on inspection before making diagnosis of Candida infection. Check pH from lateral vaginal wall.  
In pregnancy avoid oral azole. Use intravaginal\*  
Clotrimazole 10% 5g vaginal cream or Clotrimazole 500mg pessary or Fluconazole 150mg orally.  
Add topical 1% clotrimazole and 1% hydrocortisone cream if severe inflammatory component.

**Chlamydia trachomatis**  
**Chlamydia quick reference guide**  
Samples should be taken before treatment.  
Patients with symptoms, i.e. pelvic pain in women, scrotal pain or urethral discharge in men, urgently refer using the helpline number above or to the relevant service e.g urology / ED / gynaecology. Treat partners  
Pregnancy/breastfeeding: Tetracyclines are contra-indicated; Azithromycin can be used but is off-label.  
Test of cure should be done in pregnancy or after treatment with erythromycin or amoxicillin. Test of cure should be done 6 weeks after treatment.  
Azithromycin\*\* 1g stat  
Or Doxycycline 100mg BD  
Do not use doxycycline in pregnancy/ breastfeeding  
Alternatives to doxycycline:  
Erythromycin\*\*  500mg BD (less efficacious than doxycycline or azithromycin)  
or amoxicillin 500mg TDS

**Pelvic Inflammatory Disease (PID)**  
Patients with symptoms should be referred urgently to GUM, Central Sexual Health or ED if severe.  
**Essential to do dual test for N. gonorrhoea and Chlamydia AND cervical culture for gonorrhoea.**  
Gonorrhoea more likely if partner has gonococcal infection, severe symptoms, sex abroad  
PARTNERS should be tested and treated in all cases of PID. Please refer to GUM, Central Sexual Health  
**IF Gonorrhoea likely:**  
ceftriaxone 500mg IM PLUS  
metronidazole 400mg BD PLUS  
doxycycline 100mg BD  
or  
Metronidazole 400mg BD PLUS  
Ofloxacin\*\* 400mg BD
