Before You Begin

This manual is prepared to assist you with the installation, operation, and maintenance of your Fan Equipment Co. axial flow fan. The manual is generic in nature, and covers most of the concerns end users have.

Many of our assemblies are furnished with special accessories or design features. For information and instruction on custom equipment, contact your sales representative or the factory direct.

A dimensional drawing, and performance curve are furnished as a minimum for most orders.

It is imperative that an experienced mechanic, familiar with rotating machinery, install and start-up this equipment. Factory authorized servicemen are also available to assist you with installation and start-up supervision. **Fan Equipment Co. supports its' equipment with the warranty policy detailed on page 30 of this manual. Please read the warranty section thoroughly before adjusting or repairing any fan components.** Arrangements for service work are made through your sales representative or by contacting our corporate offices in Las Vegas, NV.

Engineered products are often furnished with additional data and/or information necessary for the proper operation and maintenance of your unit(s).

Please read the section discussing safety before operating your equipment.
Shipping & Receiving

Unless specifically agreed otherwise, shipments are made F.O.B. shipping point. The equipment becomes the property and responsibility of the buyer at the point of shipment. All equipment is inspected and prepared for shipment in accordance with the requirements of the commercial carrier and/or any special considerations required by the nature of the product. Rough handling or the forces encountered during a long truck route may cause damage to the unit(s). The buyer should carefully inspect the shipment before accepting delivery from the carrier. Shipping damage and claims are the responsibility of the buyer for shipments made F.O.B. shipping point.

All damage or shortages discovered at time of delivery must be noted on the carrier's freight bill or bill of lading. Any damage or shortages discovered after delivery must be reported to the carrier immediately. The carrier should inspect the damage with you and a concealed damage report filed.

Most axial fans are shipped completely assembled and mounted on wooden pallets or skids, suitable for fork lift off loading and handling. Larger equipment is furnished with lifting lugs for off loading and handling.

Large accessories such as inlet boxes, damper assemblies, and sound attenuators can be shipped separately because of handling and shipping size restrictions. Sensitive accessories such as damper actuators or other instrumentation devices are shipped separately to avoid damage in transit.

Off loading & Handling

Most shipments can be off loaded and handled by standard fork lift trucks. Lifting lugs are generally provided for attachment of lifting hooks. If necessary, lift the equipment with ropes or slings placed under structural support members or the circumference of the axial housing. Large fans that require crane equipment for handling must be lifted with a spreader bar fixture provided by others. Slings must be provided so that damage to the equipment is avoided; particularly special protective coatings provided for corrosion protection during operation. All scratches must be touched up after final installation and handling.

Fan rotors are always factory balanced before shipment. Differences in mounting shafts and foundation support structures may require a field "touch up" balance after final installation. Acceptable residual rotor unbalance levels are scheduled in other sections of this manual. When handling fan rotors; DO NOT: lift by attachment to blades or place excessive loads on shaft. The motor eye bolt is for lifting the motor only.
Storage

It is best for equipment to be installed and operated upon receipt. As this is not always possible, the equipment should be stored in a dry, protected area. The fan shaft should be protected with oil base coatings; the bearings must be kept clean, dry, and lubricated; and the fan rotor must be kept clean, dry, and free from corrosive or erosive elements. The fan rotor should be rotated frequently to circulate lubricants in the fan bearings and to prevent brinnelling of the bearings. Do not store equipment with vibration isolators installed. Never store other materials by stacking or piling items on the fan. Whether stored indoors or outside, always protect the equipment with tarps, and protect electrical equipment from corrosion.

Long Term Storage
1. If the fan is to be stored for over thirty(30) days, the following procedures are to be followed:
2. Add additional grease to bearings to fill voids and prevent condensation from accumulating.
3. Cover and seal bearings to prevent contamination.
4. Remove drive V-belts and store in a dry, protected area. Belts should be stored in plastic wrap.
5. Coat the fan shaft with grease or other protective coating.
6. Coat drive sheaves with rust preventative, and cover with plastic wrap.
7. Seal the inlet and outlet openings with heavy plywood.
8. Cover the motor with plastic wrap.
9. Cover the entire fan with protective tarps or waterproof paper.

Periodic Attention
1. Rotate the fan shaft every thirty(30) days to circulate the grease in the bearings.
2. Purge the bearings of grease and condensation every sixty(60) days. Rotate the shaft while purging grease. Do not use high pressure pneumatic greasers.
3. Renew the protective coatings on the shaft, sheaves and motor every ninety(90) days.
4. If extended factory warranty provisions are part of your purchase order, a complete log of the storage maintenance procedures is required. As a minimum you must record: the day of inspection, name of service personnel, findings and comments for each maintenance item performed.

Preparation For Start-Up
1. Prior to start-up, purge and clean the bearings, re-lubricate per the applicable bearing section that follows.
2. Remove any rust from the drive components, and inspect the drive belts for condition.
3. Manually rotate the fan impeller and check for proper running clearances.
4. Check all bearing and drive set screws, hold down bolts and motor mounting bolts for tightness.
5. Prior to installation of drive V-belts, run the motor for ten(10) minutes and confirm proper current draw and mechanical operation.
6. Follow the start-up procedures that follow in this manual.
Foundations & Support Structures

The foundation and/or support structure you provide for this equipment is essential for proper fan operation. A well designed foundation must be flat, level, and sufficiently rigid to assure that the natural vibration frequency of the foundation is stable and adequately separated from the rotational natural vibration frequency of the fan. This consideration must be closely studied when fans are mounted above grade, on structural steel support members. Incorrectly designed foundations or support structures can cause excessive equipment vibration levels and seriously endanger personnel.

The following considerations are offered as an introduction only to the fundamentals of foundation design. The fan manufacturer cannot be responsible for foundation designs. Qualified engineers familiar with local soil conditions and building codes must prepare the foundation design details.

Concrete Slab Foundations
A heavy, poured concrete slab, on grade, is the best foundation design. The concrete should weight at least 3 to 5 times the combined weight of the fan and drive component accessories. The footing should be large enough to prevent settling. The top of the slab should extend beyond the outside boundaries of the equipment by 6 to 8 inches. The slab should be poured in one piece; then bevel the edges to prevent chipping and for drainage.

The best anchor bolts are "L" or "T" shaped, and should be set in pipe sleeves approximately 2 inches larger than the anchor bolt diameter. The sleeves provide some tolerance when aligning the anchor bolts with the fan base angle foundation holes. Anchor bolt length must consider the thickness of leveling shims, the fan base angle thickness, the thickness of washers and nuts, plus allowing extra bare threads for adjustment. The thread area of the bolts must be clean and lubricated. The gap between the fan base angle and the foundation slab must be filled with grout after the fan is positioned and leveled. Gaps between the foundation slab and the fan base angle can contribute to excessive vibration.
Structural Steel Support Foundations
Fans that must be mounted above grade, on structural steel support structures, require special attention at design. The structure must be designed to support the equipment weight plus all dynamic loads of operation. Natural frequencies for fabricated structures are sometimes excited by the equipment's rotating frequencies. Support members should be as heavy as possible, and include concrete reinforcements.

The use of spring isolators for equipment mounted on structural steel work is strongly discouraged.
The use of springs adds another complication to the already difficult task of designing an adequate structural steel support structure.

Equipment Mounted Fans
Fans that are mounted as auxiliary equipment on other machines, or on mobile trailers, must be mounted so that vibration is prevented from being transmitted between the units. In certain instances, vibration isolators may be helpful.
**Suspended Fans**
For suspended units, properly selected vibration hangers must be provided. Units installed in the duct work must be provided with suspension clips and hanging rods selected with sufficient load bearing capacity to support the fan unit.
Installation & Start-Up

General Comments
It is Fan Equipment Co.'s standard procedure to test run and balance signature all complete fan units up to and including 350 HP. Your fan will be correctly aligned, lubricated, and shipped assembled; ready for mounting on a properly designed foundation. The forces encountered during shipment, handling, and rigging can however, disturb the factory settings. Before operating the fan, be sure the following items and the Start-Up Check List at the end of this manual are satisfied. Fans can be mounted either horizontally or vertically. Vertically mounted fans, however, require special considerations. Contact Fan Equipment Co. if your fan must be changed from horizontal to vertical mounting. When installing fans, be sure to allow adequate space for inspection, maintenance and lubrication. Provide access doors for duct mounted units.

Anchoring to Foundation
Position the fan such that the mounting holes in the fan base angle are in line with the anchor bolts set in the foundation. If vibration isolators are used, position the isolator’s mounting holes over the foundation anchor bolts. Lower the fan onto the anchor bolts. Level the unit, and align the duct connections with the fan flanges. The fan flanges are not designed to support duct loading or moment forces. Duct connections that are misaligned will impart loads to the fan which can distort and alter critical fan tolerances that can adversely effect performance or mechanical behavior. Grout in the gap underneath the fan base angle and securely tighten all anchor bolts.

Ceiling Suspended Units
Raise the fan into its’ proper position under the hanger rods(not supplied by Fan Equipment Co.). Insert rods through suspension clips and attach washers and fastening nuts. Level the unit and align flange mounting holes by adjusting the hanger rod length.

Duct work Supported Units
Raise the fan to its’ proper position and bolt through the fan flanges to the companion flanges of the duct work.

Bearings
Bearings on factory assembled units will have been properly lubricated, and are ready for operation. Bearings shipped loose, as replacements or spares, will require cleaning and lubrication prior to operation.

V-Belt Drives
V-belt drives on factory assembled fans have been properly aligned and tensioned. The alignment must be checked prior to operation however, to correct any movement occurring during shipping and handling. A sufficiently long straight edge or length of string is the best reference for checking the sheave alignment.
To mount V-belt drives:
1. Clean the motor and fan drive shafts, removing any protective coatings. Remove any burrs or rough spots; and coat the shafts with a light lubricant.
2. Mount the fan and motor sheaves to their respective shafts. Hand pressure only is required.

Do not pound on the sheaves with hammers to install or remove.
3. Clean the sheave grooves of all oil, rust, grease, and metal burrs.
4. Loosen the motor base adjusting screws so that the drive belts seat in the grooves without forcing. Do not roll the belts or use a tool to move the belts over the grooves.
5. Align the fan and motor shafts parallel to each other; and at right angles to the belts. Use a straight edge or length of string pulled taught over the faces of the sheaves to sight alignment.
6. Tighten the belts by adjusting the motor base adjusting screws. Proper belt tension is measured with a belt tension gauge. Excessive tension can damage the fan and/or motor bearings.

For adjustable pitch sheaves, belts are tensioned by moving the motor on its' mounts or base; not by changing the pitch diameter of sheave grooves.

Drive Motor Wiring
Wiring of all electrical accessories must be in accordance with the manufacturer's recommendations and wiring diagrams. Electric motors have connection diagrams on the nameplate. Fan motors must be connected to the power supply through a disconnect switch and magnetic starter, with suitable over-load and short circuit protection. All wiring must comply with the National Electrical Code(NEC) and local codes and requirements.

Motor conduit boxes can be rotated in 90° increments to connect to the power source. Be sure the power source voltage and amperage is compatible with the motor requirements; and that the insulation class is compatible with the ambient temperature. Electric motors are designed to run at temperatures up to 180° F. The total motor operating temperature is a combination of the ambient temperature and the motor temperature rise caused by resistance of the electrical windings. Motors are generally provided with the bearings factory lubricated and ready for operation. It is the owner's responsibility however, to confirm that the motor bearings are lubricated before start-up.
PreStart-Up Checklist

Before initial start-up, or after servicing perform this checklist:
1. CONFIRM ALL FASTENERS ARE SECURE. ALL FOUNDATION ANCHOR BOLTS, BEARING HOLD DOWN BOLTS, LOCKING COLLARS, WHEEL RETAINING SET SCREWS, BEARING SET SCREWS, AND SHEAVE MOUNTING BOLTS MUST BE PROPERLY TIGHTENED.
2. Check V-belt drive alignment.
3. Check bearing alignment and lubrication.
4. Rotate the fan wheel by hand to check that it turns freely, and does not strike the housing. DO NOT START THE FAN IF ANY METAL TO METAL RUBBING SOUNDS ARE DETECTED.
5. Confirm all electrical connections are as described in the previous section.
6. Make sure all access door and bolted covers are sealed and tight. Doors, covers and inlet cones are held by nuts threaded onto weld studs. The maximum torque allowed for these fasteners is shown in the table below.
7. Variable inlet vanes or dampers (if supplied) must move freely.
8. Duct connections must not impose loads on the fan. Expansion joints should be used when movement is expected from thermal growth or if the fan is mounted on vibration isolators. All ducts and connections must be sealed air tight. All connections must be installed so that air flow, into and out of the fan, is not obstructed.

Start-Up Procedure

After the above considerations are satisfied read all special instructions that apply and follow this procedure:

1. "Bump" the motor to determine proper direction of fan wheel rotation. Arrows on the fan or motor show correct rotation. If rotation must be changed, reverse any two(2) motor leads on three(3) phase motors. For single phase motors, refer to the motor wiring diagram.

2. Energize the starter circuit and allow the fan to accelerate to full speed. Generally motors are sized so that operating fan speed is obtained in fifteen(15) seconds. Large diameter fans may take twenty(20) or more seconds to achieve rated speed. **IT IS THE OWNER'S RESPONSIBILITY TO FURNISH ELECTRICAL COMPONENTS CONSISTENT WITH THE DRIVE MOTOR'S LOCKED ROTOR STARTING CHARACTERISTICS.**

3. The drive V-belts will "chirp" or "squeal" briefly at start-up. Higher horsepower fan drives may actually generate a small amount of smoke as the drive V-belts are suddenly activated at start-up.

4. Observe the fan and motor as the fan runs at operating speed. Unusual vibration or overheating of the bearings should be investigated. **NOTE:** It is typical for anti friction bearings to exhibit a running surface temperature in excess of 165° F. This surface will be too hot to touch, but is not cause for alarm. Refer to the engineering data supplied for your fan unit, or consult the factory for specific information regarding bearing temperatures.

5. Check the fan after it has run for approximately eight(8) hours. Stop the fan and recheck all alignments, inspect the bearings, retighten all hold down bolts, retension drive V-belts, and tighten all set screws.

6. **Axial fans must not be operated in the stall or surge region of their performance curve.** The stall/surge region of the performance curve is any region in which the system resistance line does not pass through the traditional downward sloping portion of the curve. Operation in the stall/surge region may result in severe damage to the fan equipment and/or personnel.
Assembly & Disassembly Procedures

These procedures apply to all fans. Specific instructions for special drive arrangements are noted by bold type.

Disassembly

MAKE CERTAIN THE ELECTRIC POWER IS TURNED OFF AND WILL REMAIN OFF BEFORE BEGINNING.

1. For units without mounting legs provide floor blocks to prevent rolling.
2. Remove accessories as necessary.
3. Arrangement 4: Unbolt and remove motor conduit box from fan housing. Remove the conduit tube from the housing and motor, taking care not to damage the motor leads. Remove grease fittings and grease lines.
4. Arrangement 9: Remove belt guard, inner cylinder cover plate and V-belt drive sheaves. Remove grease fittings and grease lines.
5. Remove the wheel by first unbolting the hex head draw up bolts which hold the wheel to the taper-lock bushing. Lubricate these bolts and thread into tapped holes in the wheel hub. Alternate torques until the taper fit is broken. For stubborn fits, lightly tap the hub with a mallet. Carefully slide the wheel off the shaft.
6. To remove the motor, remove the bolts holding the motor to the motor base.
7. Arrangement 9 bearing removal procedures are detailed on the following pages.

Reassembly

To reassemble, reverse the sequence of operations itemized above. Properly prepare the fan bearings for remounting (as described on the following pages), and perform these additional procedures:

1. Arrangement 4 fans - position the motor on the motor stand, tighten hold down bolts finger tight.
2. Deburr fan wheel's hub, apply a light lubricant and slide the wheel onto the shaft.
3. Adjust the wheel position to provide for proper position inside of housing. Fan wheels fastened with taper-lock bushings require the wheel to be positioned slightly back from the inlet, as the wheel will move forward when the bushing is tightened.
4. Insert key into hub. The key must extend beyond all set screw holes. Locate the key at 6 O'clock, and tighten the set screw over the keyway only. The remaining set screw will be tightened after final alignment.
5. Secure the fan to a rigid, level foundation as previously discussed.
6. Arrangement 9 fans - Align V-belt drive components; tighten down motor hold down bolts.
7. Replace all accessory items.
8. Perform Prestart-up check as described earlier.
Bearings

Fan wheels and shafts for fans furnished in arrangement Nos. 1, 8, & 9 are supported primarily by pillow block anti-friction bearings. Fan Equipment Co. uses a variety of roller and ball bearings, flange or foot mounted, depending on the application and service conditions of the fan. Generally the following procedures should be followed when disassembling and reassembling all pillow block bearings:

1. Determine the size and type of the subject bearing.
2. Note the position of the fixed and expansion bearings. Replacement in the exact location is essential for proper bearing temperature performance and service life.
3. Refer to your specific submittal data for any special considerations or procedures applicable to your fan unit.
4. Match mark all parts to avoid Reassembly errors; do not mix and interchange parts from one bearing to another. Inspect and clean all parts with mineral spirits.
5. Clean and deburr the fan shaft. Polish out all small irregularities with emery cloth. The bearing must not be seated on worn or flat sections of the shaft. Fan shafts that are worn and/or damaged must be replaced.

Slide bearings into position on the fan shaft, and follow the steps below for each type of bearing:

**Flange Cartridge; 200 and 300 Series Pillow Block Bearings**

Follow these steps for this type of bearing:

1. Slide the bearing with extended inner race into position on the fan shaft.
2. Tighten the bearing hold down bolts finger tight.
3. Align the rotating assembly so the wheel does not strike any part of the housing or inlet fixture.
4. Securely tighten the bearings to the bearing support stand.
5. Tighten the self-locking, cupped point screws or spring locking collar onto the fan shaft.
6. Reattach any extended grease lines and fittings.
7. Fill the grease lines and bearing housings with grease; taking great care not to overfill the bearing pillow block with grease. A bearing with too much grease in it will overheat and fail prematurely.
Link-Belt P-LB 6800, Dodge USAF 500 & SKF SAF 225 Series
Split Pillow Block Roller Bearings
These bearings are either fixed or floating (expansion), split pillow block, spherical roller-bearing assemblies. Installation is as follows:
1. Set the bottom section of the split housing in place on the bearing support pedestal.
2. Apply anti-seize compound to outside diameter and threads of tapered sleeve and face of lock nut to aid in tightening of the adapter.
3. Fit the multi-labyrinth seal ring (if used), adapter sleeve, roller bearing element, lock washer, lock nut and second seal loosely; slide onto the fan shaft.
4. Securely hand tighten the lock nut onto the adapter sleeve.
5. Insert feeler gauges between the outer ring and the unloaded roller bearing, on both sides of the bearing, until a snug fit is obtained. Record this gauge measurement.
6. Lower the fan shaft with the bearing and adapter assemblies into the bottom section of the pillow block housing. Take care to align the labyrinth seals with the seal grooves in the housing pillow block.
7. Loosely bolt the bottom pillow block sections to the bearing support pedestal; align the assembly with shims so that the wheel does not strike the housing or inlet fixture. Shims are also placed under the bearings to "center relieve" the hold down tension.
8. Position the floating (expansion) bearing insert centrally in the bottom pillow block housing section.
9. The fixed bearing insert is positioned for placement of a spacer ring that fits on the lock nut side to keep the bearing flush with the opposite side of the pillow block housing.
10. Snug-up the lock nut with a wrench.
11. Place a brass drift against the lock nut and strike the drift repeatedly. Evenly distribute the blows by rotating the fan shaft between strikes. This procedure drives the inner ring farther up on the adapter sleeve and releases pressure on the threads. Use the wrench again to tighten the lock nut. Repeat this procedure until the clearance has been reduced to the desired amount as shown in the table below. Record this value.
12. Secure the lock nut by bending the lock washer tang into the lock nut slot.
13. Insert the spacer into the fixed bearing housing on the lock nut side.
14. Lubricate the bearing with grease or oil.
15. Check that the bearing races are not cocked in the housing; apply a sealant such as Permatex on the housing mating surfaces; and mount the top half of the pillow block housing to the bottom half.
16. If the bearing seals are free to rotate with the shaft and stop easily; tighten the hold down cap bolts.

All dimensions in inches

When replacing bearing inserts on assembled fans it is MANDATORY that measurements and adjustments be made with ONLY the weight of the fan shaft supported by the bearings. ALL loads imposed by the fan rotor and other accessories, such as drive sheaves must be supported by blocks or other means.
**Fafnir SAL & SAOL Ball Bearings**

Fafnir SAOL type ball bearings are typically installed on high speed and/or high temperature application fan assemblies. They can be furnished with either oil or grease lubrication, however most of Fan Equipment Co.'s selections are the oil lubricated type. Replacement units are shipped with the bearing cartridges mounted inside the pillow block housings and the locking collars shipped loose for field installation. Installation is as follows:

1. Remove the end cover (2), gasket (10), plates (11), and packing (7); taking care not to damage the gasket and packing.
2. Slide a pillow block housing (1), with bearing (3), and one plate (11) onto the fan shaft. Position the bearing on the shaft taking care that the cam end of the inner ring (5) points outward.
3. To properly position the free(expansion) bearing in the housing, measure the length of the housing "L". Position the center of the bearing insert on the centerline of the housing L/2. This provides for maximum movement of the insert in both directions. Be sure the fixed and free(expansion) bearings are located in their original positions on the bearing support pedestal.
4. After alignment, bolt the pillow blocks securely in position. The outside diameter of the fan shaft and the pillow block housing bore should show equal clearance.
5. Slide the locking collar (4) into position against the bearing's inner ring (5). Turn the collar in the direction of shaft rotation until it grips the shaft and inner ring. Tighten the collar by striking with a drift pin; then tighten the set screws in the collar.
6. Put in place the gasket (10), cover (2), packing (7), and end plate (11) on the end cover. Bolt on the end cover.
7. Tighten the screws holding the end plates just enough to hold the packing rings firmly in place. Over tightening at this point may cause binding which will cause excessive heat in the bearing.
8. Fill the pillow block with oil at the top cup (6), until the overflow cup (9) is full. **FILL ONLY WHEN THE FAN IS NOT RUNNING.**
9. To disassemble the reverse procedure is used **taking care to remove the burr on the shaft caused by the collar set screws before removing the pillow block from the shaft.**
Aligning ring on floating bearing must be located centrally in housing

Upper section shows bearing floating (Remove spacer ring - part 8)

Centerline of overflow

Lower section shows bearing fixed

(With spacer ring)

**V-Belt Drives**

V-belt driven fans that are factory assembled have been aligned and test run before shipping. Because of the forces encountered during shipping and handling the drive alignment must be checked before operation as follows:

1. Check that sheaves are locked in position with keys firmly installed and seated.
2. The sheave faces must be parallel as checked with a straight edge or string.
3. Start the fan and check for proper rotation.
4. Run the fan at operating speed. A slight bow should appear on the slack side of the belts.
5. Adjust belt tension, if required, with a belt tension gauge by adjusting the position of the motor on its’ sliding base.
6. The drive belts will squeal a bit, especially higher horsepower units, upon start up. **DO NOT OVER TIGHTEN THE BELTS.**

**To assemble or replace V-belt drives**

1. Clean the motor and fan shafts. Be sure they are free from corrosion. Clean the bore of each sheave and coat with white grease or oil. Then remove all oil, grease, rust and burrs from the sheaves.
2. Place the fan and motor sheaves on their respective shafts. **DO NOT POUND THE SHEAVES ONTO THE SHAFTS,** as this might damage the bearings. Tighten the sheaves in place. The sheave should be as near as possible to its’ bearing without the sheave or belts hitting the support pedestals.
3. Move the motor on its' slide base until the belts can be placed in the sheave grooves without forcing. Do not roll belts or use a tool to force the belts over the grooves.

4. Adjust the fan and motor sheaves so they are parallel. Use a straight edge or string pulled taught against the sheave faces to check for squareness. The belts should be at right angles to the shafts.

5. Tighten the belts by adjusting the motor slide rail screws, moving the motor back on its' base. Use a belt tension gauge to determine proper belt tension. Excessive tension can cause premature bearing and/or belt failure.

6. Start the fan and run at full speed. Adjust belt tension until a slight bow appears on the slack side of the belts. Give the belts a few days running time-then readjust the belt tension.

**Variable Inlet Vane Dampers (V.I.V.s)**

Variable inlet vane dampers are used to control the fan's capacity through moveable vanes located at the fan inlet. The vanes are joined together by a linkage assembly so that the vanes move in unison when operating the control shaft. Most V.I.V. assemblies are furnished as separate bolt-on sections.

The V.I.V. section is assembled and adjusted for proper operation at the factory before shipment. When the fan is received at the job site; check that the vanes spin the air in the same direction as the wheel rotates. Before the inlet duct work is attached, operate the control lever to make certain the vanes move freely from full open to full closed.

V.I.V.s furnished for manual operation are furnished with a locking quadrant and wing nut to fix the control lever after system adjustments are made.

V.I.V.s are also furnished with automatic actuators which follow a system control signal to balance air flow performance. Automatic actuators come in all sizes and shapes. The mounting bracket is the responsibility of those supplying and mounting the actuator. When called for, Fan Equipment Co. furnishes and factory mounts the automatic actuator assemblies.
High Temperature Fans

A heat slinger is a split aluminum rotor bolted to high temperature fan shafts to dissipate heat conducted along the fan shaft; and to induce air flow around bearing housings. Heat slingers are installed by placing the two(2) halves over the fan shaft and bolting together as follows:

The open side of the heat slinger should face the fan when the fan has oil lubricated bearings. The open side of the heat slinger should face the bearings when the fan is furnished with grease lubricated bearings.

High temperature fans can also be furnished with small, forwardly curved fans installed in the fan's inner cylinder to aspirate the inner cylinder and fan bearings. This system draws cooler ambient air through the belt fairing or breather slots, into the fan's inner cylinder, cooling the bearings. These aspirating wheels are fit with an inlet cone bolted into the inner cylinder behind the cover plate. These inlet cones and aspirating wheels must be removed to gain access to the driven fan sheave. The fan's inner cylinder is often provided with thermal insulation to protect the fan bearings from high temperature gas streams.

Shaft Seals

Simple rubbing shaft seals are provided for most fan applications. These seals are cut from rigid sheets of compressed carbon fiber or Teflon®. The seals are held in place by weld studs and a retaining plate. Air leakage along the fan shaft is minimal, but definitely present.
Preventive Maintenance and Lubrication

Maintenance
To insure trouble free operation and long life, a regular schedule of preventive maintenance and lubrication must be followed. Frequency of inspection and lubrication depend upon the operating conditions and the time period the fan is used. We recommend daily observation after the fan is first put into service, to determine the inspection and lubrication requirements.

Do not make any repairs or alterations to the fan equipment during the warranty period without Fan Equipment Co.'s prior authorization or the warranty is void.

Caution: Before performing any inspection, make sure that the fan is locked OFF so that the unit cannot be started. Do not shut down fans handling high temperature gas or air until the system cools down.

Periodic inspections should include the following items:
1. **Air Flow** - Check for obstructions, dirt rags, etc. in the inlet or outlet duct work.
2. **Screens, V.I.V.s, and other flow accessories** - Clear periodically, dirt causes resistance to air flow, decreasing the air volume supplied by the fan.
3. **V-belt Drives** - Check for belt wear, alignment of sheaves, and belt tension. Replace belts in matched sets only. New belts will not perform properly when used with used belts because of length differences. Belts must be free from grease and oils.
4. **Wheel** - Inspect the blades for dust or dirt accumulation. Particulate build up can cause unbalance. Cover the bearings with plastic film and clean with steam, water jet, compressed air, or wire brush. If blades are aluminum, be careful not to damage them while cleaning. Make sure wheel is centered to prevent blades from striking the housing. Check for proper wheel rotation. If cracks are found in the wheel, remove the fan from service until proper repairs can be made.
5. **Hardware** - Check that all foundation bolts, wheel hubs, set screws, wheel locking fixtures and bearing hold down bolts are sufficiently tight.
6. **Shaft** - Check that all shafts are properly aligned. The shaft must not be cocked in the bearings because misalignment causes overheating, wear to dust seals, bearing failure, and rotor unbalance.
7. **Bearings** - Check for excessive temperature or chatter in all bearings. High speed bearings are designed to run at temperatures above 165°F. *Do not replace a bearing simply because it feels hot.* Check the pillow block temperature with an accurate surface contact thermometer and contact Fan Equipment Co. for assistance.

8. **Surface Coatings** - Check that surface coatings or paints are in good condition. Repainting of exterior and interior surfaces extends the service life of your equipment. Select coatings to withstand the operating temperature and chemical content of the gas stream. For normal temperature and service conditions, a good machinery enamel may be used.

9. **Alignment** - Check the alignment of fan bearings, wheel and inlet cones regularly. Misalignment causes bearing and/or motor overheating, wear to dust seals, bearing failure, and rotor unbalance.

10. **Damper and V.I.V.s** - The linkage connections must be checked for tightness. Check all automatic dampers for freedom of movement. Blades should close tightly and evenly. Clean damper blades and linkages and inspect for corrosion and erosion. Observe as operating motors and controls stroke through a complete cycle - make adjustments or repairs as necessary.

11. **Motors** - Blow out open motor windings with low pressure air (less than 50 PSIG) to remove dust or dirt, because contamination causes excessive insulation temperatures. *Keep motors dry.* When motors are idle for long periods of time, single phase heating or small space heaters may be necessary to prevent water condensation on the windings. *Be sure the motor is not overloaded. Excessive starting of motors may burn out the motor.* Check the amperage draw against the motor nameplate rating; and consult the manufacturer for the maximum allowable number of consecutive starts.
Safety

Improperly installed or operated fans are a hazard to both people and property. Fans should always be installed by trained and experienced personnel. Installations must meet all pertinent state and local safety codes and the requirements of the Occupational Safety and Health Act (OSHA).

Each fan is designed to operate safely up to a stated maximum speed (RPM) and temperature.

DO NOT EXCEED THESE LIMITS.

Fans are specialized equipment which involve high speed rotating elements which can be dangerous if handled improperly. Individuals who are not familiar with the equipment and proper servicing methods may not realize the harm they can do to themselves or the fan; and should NEVER be permitted to work on the fan. Fans are sold with the understanding that customers will recognize the risk of high speed rotating elements and understand that only people who are aware of the risks associated with the essential operating characteristics of a fan should be permitted to work on them.

SAFETY CHECK LIST

We suggest the following points be included in your Safety Checklist Program:

1. Couplings and V-belt drives must have guards that completely encase the rotating parts. Do not start or operate the equipment without guards.
2. Shaft guards should be provided for Arrangement No. 8 fans that extend from one bearing to the outside of the fan casing.
3. Screens should be provided for open inlet fans, and for outlets not connected to duct work.
4. Accessories with moving parts such as tachometers and turning gears must have guards.
5. Before start-up be sure all parts are tight; that all tools and materials have been removed from the area, and that all personnel are clear.
6. The periodic maintenance and lubrication procedures outlined in this manual must be faithfully followed.
7. A lock out procedure to ensure that the fans cannot start when maintenance personnel are performing service functions is mandatory. It is customary to lock out the power from the drive and use red tags to alert personnel to the shut down.

Only well trained personnel should assemble, maintain, or replace these fans.
- NEVER allow an untrained person to work on the fan.
- NEVER remove warning labels and this manual from the fan.
- NEVER run the fan without all safety guards in place.
**Trouble shooting**

If you are questioning the performance of your fan, check the table below before calling for service. To use this table, match your problem with the symptom in the left column. For each symptom, the most likely causes are shown in the middle column. The suggested solutions are shown in the right column:

<table>
<thead>
<tr>
<th>Symptom Capacity or pressure below rating</th>
<th>Cause Total system resistance is higher than design</th>
<th>Solution Increase fan speed. Consult the factory before proceeding</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed too low</td>

## Maintenance Procedures

**Rotor Balancing**
All Fan Equipment Co. rotors(wheels) are balanced at the factory before shipment. Fans shipped assembled have also had a running test performed to confirm mechanical and balance characteristics are correct. A fan handling clean, dry air should not need balancing once it is installed and running properly. Dust or particulate build up on fan rotors causes unbalance. Inspect your fan periodically to determine the amount of dust build up or blade wear. Before balancing a rotor, check the preceding troubleshooting section.

Portable instruments are available that indicate vibration displacement in mils (1 mil = 0.001 inches), or velocity in inches/second. If you have vibration instrumentation, use the table below to determine when your fan is operating with too much vibration.

<table>
<thead>
<tr>
<th>RPM</th>
<th>Initial Operation</th>
<th>Shut Down</th>
</tr>
</thead>
<tbody>
<tr>
<td>3600</td>
<td>1.2</td>
<td>0.23</td>

<tr>
<td>720</td>
<td>2.0</td>
<td>0.07</td>
</tr>
</tbody>
</table>

* A radial displacement indication of 1.2 mils at the fan flange has been found to represent a radial displacement at the fan bearings of 0.75 mils. This ratio is approximate and may vary with equipment design and support system.

1. When the fan operating frequency falls between the above listed frequencies, the value for the higher frequency should be used.
2. Displacement is a measured value with the probe or seismic type pickup positioned firmly on the fan bearing housing, in the desired plane of measurement. Displacement is a peak-to-peak (full wave) value.
3. Initial operation values are expected values for clean, well maintained and balanced fans operating at steady state conditions after transient conditions of start up, i.e. acceleration, temperature changes, etc. have stabilized. The values (for measurement of equipment unbalance) must be taken for the exact fan operating frequency, filtering out extraneous values that can be measured for different frequencies.
4. Operation of any fan above the shut down levels listed above may cause equipment failure and extensive damage, as well as endangerment to personnel. A corrective measure would be to retain an authorized service representative to inspect the installation, suggest corrective measures, and balance the rotating assembly as necessary.
5. Fan Equipment Co. balances and run tests the equipment on a heavy concrete foundation. Installation variables, such as (but not limited to) foundations and mounting provisions, may result in vibration levels somewhat different from the levels achieved at the factory.

6. When vibration isolation systems, such as spring isolators are used, fan balancing should be performed with the isolator components "locked out" to establish a rigid structure. The isolation components should be readjusted after final balance is achieved.

**Bearing Servicing, Cleaning, and Lubrication**

**When ball or roller bearings are disassembled for service:**

1. Remove bearing races from shaft, place in a suitable container with clean petroleum solvent or kerosene and soak. If kerosene is used, all parts must be wiped dry with a clean cloth. Rotate each bearing by hand to dislodge any dirt particles.

2. Remove old grease and oil from the bearing pillow block. The solvent or kerosene can be used to clean the housing. Carefully wipe all parts dry with a clean cloth to prevent dilution of the new lubricant by the solvent.

3. When bearing grease is badly oxidized, soak in light oil (SAE 10 motor oil) at 200° to 240° F before cleaning as discussed above. Spin the clean bearing in light oil to remove solvent.

4. Reassemble and add lubricant to the correct level.

5. To clean bearings without removing them from the pillow blocks, flush 180° to 200° F light oil, kerosene or solvent through the pillow block while rotating the shaft slowly. Remove badly oxidized grease by flushing with hot aqueous emulsions. Drain the solution, flush the pillow block with hot, light oil and re-drain before adding new lubricant.

**Lubrication**

This section provides guidelines for the oil and grease lubrication of ball and roller bearings. Lubrication schedules are attached to the fan along side the fan nameplate for grease lubricated units. Fans furnished for special service conditions requiring specific lubrication instructions are furnished with this data as part of the fan data submittals. Please contact Fan Equipment Co. if you require assistance or additional information about the lubrication requirements of your fan.

Fans that are shipped assembled have been lubricated at the factory; but should be checked before start-up. Oil lubricated bearings must always be checked as oil can easily spill during shipment. Replacement bearings normally are not lubricated. Before installation and lubrication, clean the bearing thoroughly, wash out the rust preventative with a petroleum solvent, and dry the parts with a clean cloth.
**Grease Lubricated Bearings**
Because bearings operate at high temperatures, a good grade of lubricant is essential. The lube data furnished with your fan unit should be followed. The following table shows acceptable lubricants. *Not all greases are chemically compatible.* If you intend to change the grade or type of lubricant; flush out all the old lubricant before proceeding.

</table>

*The use of EP or long fibered greases is not recommended.*
**Greasing Procedure**
Open the pipe plug or grease relief fitting in the bottom of the pillow block to allow excess grease to escape. Be careful to prevent dirt from entering the bearing. Fill the pillow block approximately 1/3 full. **Too much grease can cause the bearing to overheat resulting in premature failure.**

**Lubrication Frequency**
The lubrication schedule for any application is determined by the operating conditions. Bearings handling clean, dry air at room temperatures will require less frequent lubrication (every 6 to 10 months) than bearings in dirty, hot environments (every 1 to 4 weeks). Relubrication is important as it purges contaminants from the bearing. Determine the correct lubrication schedule for your installation by visually examining the purged lubricant. If the lubricant is clean, lengthen the time between relubrications; if it is contaminated, shorten the interval.

**Oil Lubricated Bearings**
Oil lubricated bearings are much more sensitive to lubrication requirements than grease lubricated units. Lubricating oils must be free from water, sediment acids or resins and have sufficient viscosity for the fan operating temperatures. Viscosity is measured in SUS units (Saybolt Universal Seconds). The larger the SUS rating, the better the filming action of the oil. Viscosity drops as the temperature of the oil increases. A typical SAE 20 weight oil has an SUS rating of 348 at 100°F; and an SUS rating of 57 at 210°F. Generally oils are provided as follows:

<table>
<thead>
<tr>
<th>Bearing Type</th>

</tr>
<tr>
<td>SAE 30 Wt.</td>
<td>SUS 489 @ 100°F; 65 @ 210°F</td>
</tr>
</tbody>
</table>
**Oil Lubricating Procedure**
With the fan stopped, add oil until the level is 1/4" below the cap of the oil cup attached to the bearing pillow block; or until the oil is at the level mark indicated on the sight gauge (if supplied). If the fan cannot be stopped to check the oil level, an operating oil level must be established. At initial start up, with the oil at proper level, and the fan at operating temperature; mark the operating oil level while the fan is running. The *minimum* safe operating oil level is 1/8" below this mark.

**Motor Bearing Lubrication**
Motors are generally shipped with the bearings lubricated. For specific instructions consult the motor manufacturer’s maintenance manual.
Ordering Replacement Parts

Replacement parts can be ordered from your local sales representative or by contacting the Fan Equipment Co. factory. The following information is required:
1. Fan order or serial number that is stamped on the fan nameplate.
2. Fan size and type.
3. Fan arrangement.
4. Description of part(s) required.
5. Any special materials of construction, paints or coatings.

Additional Information
To order wheels, shafts, motors, bearings, or drive components, the following additional information is required:
1. **Wheel** - Indicate size and class of wheel; direction of rotation; operating speed and temperature; material of construction.
2. **Shaft** - Provide length; diameter; material; and keyway dimensions.
3. **Bearings** - For anti-friction bearings, specify: ball or roller type; size; manufacturer; whether fixed or expansion.
4. **Drive components** - Identify sheave size and type; bushing size; V-belt number and size; or flexible coupling component required.
5. **Motors** - The name of the motor manufacturer and the nameplate data.

Recommended Spare Parts
The following spare parts are recommended for all fans:
1. **Bearings** - Shaft seals and housing split gaskets if furnished for your equipment.
2. **Drive components** - Drive V-belts.
3. **Gaskets** - Shaft seal(s) and gaskets for housing splits.

For fans operating in hostile environments, where corrosion or erosion is present, or for fans that are essential to the operation of your particular system or plant facility; we recommend the following spares inventory:
1. Fan shaft.
2. Fan wheel
3. Fan bearings
4. Drive V-belts.
Warranty

Unless otherwise agreed upon in writing, all shipments are made F.O.B. shipping point. Responsibility for damage or loss of products is transferred to the owner at this time. Unless specific instructions are included in the customer’s purchase order, all shipments will be prepared for common carrier truck transportation. Packaging will be suitable to protect the product under normal circumstances, and to the acceptance standards of the carrier.

Fan Equipment Co., Inc. warrants that the design, construction and materials of our products will be first-class, and free from defects in the materials and workmanship for a period not to exceed eighteen (18) months from shipment or twelve (12) months from date of installation, whichever occurs first. Our sole obligation under this Warranty is limited to the repair or replacement, without charge, at the purchase order F.O.B. point, any defective parts. Fan Equipment Co., Inc. will not be responsible for damages, contingent liabilities, or consequential damages of any nature, resulting from the above stated Warranty; or from any defect in our products, either in materials, design, or construction, or arising from the use of such products. **We do not guarantee against abrasion, corrosion, erosion, or accumulation of material on the fan rotor (buildup).**

The above stated Warranty is given expressly in lieu of all other warranties express or implied, including warranties of merchantability and fitness for particular purpose, and constitutes the only Warranty made by seller.

Warranties on equipment not of our manufacture are limited to the Warranty terms of our suppliers.

All Warranty claims must be submitted to Fan Equipment Co., Inc. within ten (10) days of discovery of defect within the warranty period, or shall be deemed waived. Do not attempt to make any repairs on the fan equipment during the warranty period without the prior written authorization of Fan Equipment Co., Inc. or its' representatives; otherwise the Warranty is voided.

Fan Equipment Co., Inc. shall not be liable for any injury to persons or property resulting from improper installation, operation, misapplication, neglect, modification, repair, or maintenance (including lubrication) of equipment by customers or third parties.
