GIVE SAFETY THE RIGHT OF WAY
Motorcycles are fascinating vehicles, which can give you an unsurpassed feeling of power and freedom. However, they also impose certain limits, which you must accept; even the best motorcycle does not ignore the laws of physics.

Regular care and maintenance are essential for preserving value and operating condition of your motorcycle. Moreover, what is true for the motorcycle is also true for the rider: good performance depends on being in good shape. Riding under the influence of medication, drugs and alcohol is, of course, out of the question. Motorcycle riders—more than car drivers—must always be at their mental and physical best. Under the influence of even small amounts of alcohol, there is a tendency to take dangerous risks.

Protective clothing is as essential for the motorcycle rider as seat belts are for car drivers and passengers. Always wear a complete motorcycle suit (whether made of leather or tear-resistant synthetic materials with protectors), sturdy boots, motorcycle gloves and a properly fitting helmet. Optimum protective wear, however, should not encourage carelessness. Although full-coverage helmets and suits, in particular, create an illusion of total safety and protection, motorcyclists will always be vulnerable. Riders who lack critical self-control run the risk of going too fast and are apt to take chances. This is even more dangerous in wet weather. The good motorcyclist rides safely, predictably and defensively—avoiding all dangers, including those caused by others.

Enjoy your ride!

The main switch/steering lock controls the ignition and lighting systems, and is used to lock the steering. The various positions are described below.

ON
All electrical systems are supplied with power, and the engine can be started. The key cannot be removed.

OFF
All electrical systems are off. The key can be removed.

LOCK
The steering is locked, and all electrical systems are off. The key can be removed.

To lock the steering
1. Turn the handlebars all the way to the left.
2. Push the key in from the “OFF” position, and then turn it to “LOCK” while still pushing it.
3. Remove the key.

To unlock the steering
Push the key in, and then turn it to “OFF” while still pushing it.

**WARNING**

Never turn the key to “OFF” or “LOCK” while the motorcycle is moving, otherwise the electrical systems will be switched off, which may result in loss of control or an accident. Make sure that the motorcycle is stopped before turning the key to “OFF” or “LOCK”.

**CAUTION:**

Do not use the parking position for an extended length of time, otherwise the battery may discharge.
INSTRUMENT AND CONTROL FUNCTIONS

Indicator lights

High beam indicator light “H”
This indicator light comes on when the high beam of the headlight is switched on.

Neutral indicator light “N”
This indicator light comes on when the transmission is in the neutral position.

Turn signal indicator light “<”
This indicator light flashes when the turn signal switch is pushed to the left or right.

Speedometer unit
The speedometer unit is equipped with a speedometer, an odometer and a tripmeter. The speedometer shows riding speed. The odometer shows the total distance traveled. The tripmeter shows the distance traveled since it was last set to zero with the reset knob. The tripmeter can be used to estimate the distance that can be traveled with a full tank of fuel. This information will enable you to plan future fuel stops.
INSTRUMENT AND CONTROL FUNCTIONS

1. Tachometer
   a. Red zone

**Tachometer**
The tachometer allows the rider to monitor the engine speed and keep it within the ideal power range.

**CAUTION:**
Do not operate the engine in the tachometer red zone.

**Start switch “$”**
Push this switch to crank the engine with the starter.

**CAUTION:**
See page 5-1 for starting instructions prior to starting the engine.

**Clutch lever**
The clutch lever is located at the left handlebar grip. To disengage the clutch, pull the lever toward the handlebar grip. To engage the clutch, release the lever. The lever should be pulled rapidly and released slowly for smooth clutch operation.
The clutch lever is equipped with a clutch switch, which is part of the ignition circuit cut-off system. (See page 3-12 for an explanation of the ignition circuit cut-off system.)
INSTRUMENT AND CONTROL FUNCTIONS

Shift pedal
The shift pedal is located on the left side of the engine and is used in combination with the clutch lever when shifting the gears of the 5-speed constant-mesh transmission equipped on this motorcycle.

Brake lever
The brake lever is located at the right handlebar grip. To apply the front brake, pull the lever toward the handlebar grip.

Brake pedal
The brake pedal is on the right side of the motorcycle. To apply the rear brake, press down on the brake pedal.
INSTRUMENT AND CONTROL FUNCTIONS

Fuel tank cap

To remove the fuel tank cap
1. Insert the key into the lock and turn it 1/4 turn counterclockwise.
2. Turn the fuel tank cap 1/3 turn counterclockwise and pull it off.

To install the fuel tank cap
1. Insert the fuel tank cap into the tank opening with the key inserted in the lock, and then turn the cap 1/3 turn clockwise.
2. Turn the key 1/4 turn clockwise, and then remove it.

NOTE:
The fuel tank cap cannot be installed unless the key is in the lock. In addition, the key cannot be removed if the cap is not properly installed and locked.

WARNING
Make sure that the fuel tank cap is properly closed and locked before riding.

Fuel

Make sure that there is sufficient fuel in the tank. Fill the fuel tank to the bottom of the filler tube as shown.

WARNING
- Do not overfill the fuel tank, otherwise it may overflow when the fuel warms up and expands.
- Avoid spilling fuel on the hot engine.
Immediately wipe off spilled fuel with a clean, dry, soft cloth, since fuel may deteriorate painted surfaces or plastic parts.

Recommended fuel: REGULAR UNLEADED GASOLINE ONLY
Fuel tank capacity:
- Total amount: 15.0 L
- Reserve amount: 2.0 L

Use only unleaded gasoline. The use of leaded gasoline will cause severe damage to internal engine parts, such as the valves and piston rings, as well as to the exhaust system.

Your Yamaha engine has been designed to use regular unleaded gasoline with a research octane number of 91 or higher. If knocking (or pinging) occurs, use a gasoline of a different brand or premium unleaded fuel. Use of unleaded fuel will extend spark plug life and reduce maintenance costs.
**Instruments and Control Functions**

**Fuel Cock**

The fuel cock supplies fuel from the tank to the carburetor while filtering it also. The fuel cock has three positions:

- **OFF**
  - With the lever in this position, fuel will not flow. Always return the lever to this position when the engine is not running.

- **ON**
  - Arrow mark pointing over “ON”
  - With the lever in this position, fuel flows to the carburetor. Normal riding is done with the lever in this position.

- **RES**
  - Arrow mark pointing over “RES”
  - This indicates reserve. If you run out of fuel while riding, move the lever to this position. Fill the tank at the first opportunity. Be sure to set the lever back to “ON” after refueling!
INSTRUMENT AND CONTROL FUNCTIONS

**Starter (choke) knob “|\]|”**
Starting a cold engine requires a richer air-fuel mixture, which is supplied by the starter (choke).
Move the knob in direction \(\text{a}\) to turn on the starter (choke).
Move the knob in direction \(\text{b}\) to turn off the starter (choke).

**Seat**

**To remove the seat**
Remove the bolts, and then pull the seat off.

**To install the seat**
1. Insert the projections on the front of the seat into the seat holders as shown.
2. Place the seat in the original position, and then tighten the bolts.

**NOTE:**
Make sure that the seat is properly secured before riding.
INSTRUMENT AND CONTROL FUNCTIONS

Helmet holder
To open the helmet holder, insert the key into the lock, and then turn the key as shown. To lock the helmet holder, place it in the original position, and then remove the key.

WARNING
Never ride with a helmet attached to the helmet holder, since the helmet may hit objects, causing loss of control and possibly an accident.

Adjusting the shock absorber assembly
This shock absorber assembly is equipped with a spring preload adjusting nut.

CAUTION:
Never attempt to turn an adjusting mechanism beyond the maximum or minimum settings.

Adjust the spring preload as follows.
1. Loosen the locknut.
2. To increase the spring preload and thereby harden the suspension, turn the adjusting nut in direction (a). To decrease the spring preload and thereby soften the suspension, turn the adjusting nut in direction (b).

NOTE:
The spring preload setting is determined by measuring distance A, shown in the illustration. The shorter distance A is, the lower the spring preload; the longer distance A is, the higher the spring preload.
INSTRUMENT AND CONTROL FUNCTIONS

Spring preload:
Minimum (soft):
    Distance A = 1 mm
Standard:
    Distance A = 5.5 mm
Maximum (hard):
    Distance A = 12 mm

3. Tighten the locknut to the specified torque.

Tightening torque:
Locknut:
42 Nm (4.2 m·kgf)

CAUTION:
Always tighten the locknut against the adjusting nut, and then tighten the locknut to the specified torque.

WARNING
This shock absorber contains highly pressurized nitrogen gas. For proper handling, read and understand the following information before handling the shock absorber. The manufacturer cannot be held responsible for property damage or personal injury that may result from improper handling.

- Do not tamper with or attempt to open the gas cylinder.
- Do not subject the shock absorber to an open flame or other high heat sources, otherwise it may explode due to excessive gas pressure.
- Do not deform or damage the gas cylinder in any way, as this will result in poor damping performance.
- Always have a Yamaha dealer service the shock absorber.

Sidestand
The sidestand is located on the left side of the frame. Raise the sidestand or lower it with your foot while holding the motorcycle upright.

NOTE:
The built-in sidestand switch is part of the ignition circuit cut-off system, which cuts the ignition in certain situations. (See further down for an explanation of the ignition circuit cut-off system.)
The motorcycle must not be ridden with the sidestand down, or if the sidestand cannot be properly moved up (or does not stay up), otherwise the sidestand could contact the ground and distract the operator, resulting in a possible loss of control. Yamaha’s ignition circuit cut-off system has been designed to assist the operator in fulfilling the responsibility of raising the sidestand before starting off. Therefore, check this system regularly as described below and have a Yamaha dealer repair it if it does not function properly.

**Ignition circuit cut-off system**

The ignition circuit cut-off system (comprising the sidestand switch, clutch switch and neutral switch) has the following functions.

- It prevents starting when the transmission is in gear and the sidestand is up, but the clutch lever is not pulled.
- It prevents starting when the transmission is in gear and the clutch lever is pulled, but the sidestand is still down.
- It cuts the running engine when the transmission is in gear and the sidestand is moved down.

Periodically check the operation of the ignition circuit cut-off system according to the following procedure.

---

**WARNING**

If a malfunction is noted, have a Yamaha dealer check the system before riding.
INSTRUMENT AND CONTROL FUNCTIONS

With the engine turned off:
1. Move the sidestand down.
2. Make sure that the engine stop switch is set to “C”.
3. Turn the key to “ON”.
4. Shift the transmission into the neutral position.
5. Push the start switch.

Does the engine start?

YES  NO

With the engine still running:
6. Move the sidestand up.
7. Keep the clutch lever pulled.
8. Shift the transmission into gear.
9. Move the sidestand down.

Does the engine stall?

YES  NO

After the engine has stalled:
10. Move the sidestand up.
11. Keep the clutch lever pulled.
12. Push the start switch.

Does the engine start?

YES  NO

The system is OK. The motorcycle can be ridden.

NOTE:
This check is most reliable if performed with a warmed-up engine.

With the engine still running:
The neutral switch may be defective. The motorcycle should not be ridden until checked by a Yamaha dealer.

With the engine turned off:
The sidestand switch may be defective. The motorcycle should not be ridden until checked by a Yamaha dealer.

The clutch switch may be defective. The motorcycle should not be ridden until checked by a Yamaha dealer.
Pre-operation check list ................................................................. 4-1
The condition of a vehicle is the owner’s responsibility. Vital components can start to deteriorate quickly and unexpectedly, even if the vehicle remains unused (for example, as a result of exposure to the elements). Any damage, fluid leakage or loss of tire air pressure could have serious consequences. Therefore, it is very important, in addition to a thorough visual inspection, to check the following points before each ride.

OPERATION AND IMPORTANT RIDING POINTS

**WARNING**
- Become thoroughly familiar with all operating controls and their functions before riding. Consult a Yamaha dealer regarding any control or function that you do not thoroughly understand.
- Never start the engine or operate it in a closed area for any length of time. Exhaust fumes are poisonous, and inhaling them can cause loss of consciousness and death within a short time. Always make sure that there is adequate ventilation.
- Before starting out, make sure that the sidestand is up. If the sidestand is not raised completely, it could contact the ground and distract the operator, resulting in a possible loss of control.

**Starting the engine**

In order for the ignition circuit cut-off system to enable starting, one of the following conditions must be met:
- The transmission is in the neutral position.
- The transmission is in gear with the clutch lever pulled and the sidestand up.

**NOTE:**
When the transmission is in the neutral position, the neutral indicator light should be on, otherwise have a Yamaha dealer check the electrical circuit.

1. Turn the fuel cock lever to “ON”.
2. Turn the key to “ON” and make sure that the engine stop switch is set to “O”.
3. Shift the transmission into the neutral position.

**WARNING**
- Before starting the engine, check the function of the ignition circuit cut-off system according to the procedure described on page 3-13.
- Never ride with the sidestand down.

4. Turn the starter (choke) on and completely close the throttle. (See page 3-9 for starter (choke) operation.)
5. Start the engine by pushing the start switch.
OPERATION AND IMPORTANT RIDING POINTS

NOTE: __________________________
If the engine fails to start, release the start switch, wait a few seconds, and then try again. Each starting attempt should be as short as possible to preserve the battery. Do not crank the engine more than 10 seconds on any one attempt.

6. After starting the engine, move the starter (choke) knob back halfway.

CAUTION: __________________________
For maximum engine life, always warm the engine up before starting off. Never accelerate hard when the engine is cold!

7. When the engine is warm, turn the starter (choke) off.

NOTE: __________________________
The engine is warm when it responds normally to the throttle with the starter (choke) turned off.

Starting a warm engine
Follow the same procedure as for starting a cold engine with the exception that the starter (choke) is not required when the engine is warm.
OPERATION AND IMPORTANT RIDING POINTS

Shifting gears lets you control the amount of engine power available for starting off, accelerating, climbing hills, etc. The gear positions are shown in the illustration.

NOTE:
To shift the transmission into the neutral position, press the shift pedal down repeatedly until it reaches the end of its travel, and then slightly raise it.

CAUTION:
- Even with the transmission in the neutral position, do not coast for long periods of time with the engine off, and do not tow the motorcycle for long distances. The transmission is properly lubricated only when the engine is running. Inadequate lubrication may damage the transmission.
- Always use the clutch while changing gears to avoid damaging the engine, transmission, and drive train, which are not designed to withstand the shock of forced shifting.

Recommended shift points (for Switzerland only)
The recommended shift points during acceleration are shown in the table below.

<table>
<thead>
<tr>
<th>Shift point (km/h)</th>
<th>1st → 2nd</th>
<th>2nd → 3rd</th>
<th>3rd → 4th</th>

<td>50</td>
<td></td>
</tr>
<tr>
<td>4th → 5th</td>
<td></td>
<td></td>
<td></td>
<td>60</td>
</tr>
</tbody>
</table>

NOTE:
When shifting down two gears at a time, reduce the speed accordingly (e.g., down to 35 km/h when shifting from 4th to 2nd gear).
OPERATION AND IMPORTANT RIDING POINTS

Tips for reducing fuel consumption
Fuel consumption depends largely on your riding style. Consider the following tips to reduce fuel consumption:

- Thoroughly warm up the engine.
- Turn the starter (choke) off as soon as possible.
- Shift up swiftly, and avoid high engine speeds during acceleration.
- Do not rev the engine while shifting down, and avoid high engine speeds with no load on the engine.
- Turn the engine off instead of letting it idle for an extended length of time (e.g., in traffic jams, at traffic lights or at railroad crossings).

Engine break-in
There is never a more important period in the life of your engine than the period between 0 and 1,600 km. For this reason, you should read the following material carefully. Since the engine is brand new, do not put an excessive load on it for the first 1,600 km. The various parts in the engine wear and polish themselves to the correct operating clearances. During this period, prolonged full-throttle operation or any condition that might result in engine overheating must be avoided.

0–1,000 km
Avoid prolonged operation above 4,000 r/min.

1,000–1,600 km
Avoid prolonged operation above 5,000 r/min.

CAUTION:
After 1,000 km of operation, the engine oil must be changed, and the oil filter element replaced.

1,600 km and beyond
The vehicle can now be operated normally.
OPERATION AND IMPORTANT RIDING POINTS

CAUTION:

- Keep the engine speed out of the tachometer red zone.
- If any engine trouble should occur during the engine break-in period, immediately have a Yamaha dealer check the vehicle.

Parking

When parking, stop the engine, remove the key from the main switch, and then turn the fuel cock lever to "OFF".

WARNING

- Since the engine and exhaust system can become very hot, park in a place where pedestrians or children are not likely to touch them.
- Do not park on a slope or on soft ground, otherwise the motorcycle may overturn.

PERIODIC MAINTENANCE AND MINOR REPAIR

Safety is an obligation of the owner. Periodic inspection, adjustment and lubrication will keep your vehicle in the safest and most efficient condition possible. The most important points of inspection, adjustment, and lubrication are explained on the following pages.

The intervals given in the periodic maintenance and lubrication chart should be simply considered as a general guide under normal riding conditions. However, DEPENDING ON THE WEATHER, TERRAIN, GEOGRAPHICAL LOCATION, AND INDIVIDUAL USE, THE MAINTENANCE INTERVALS MAY NEED TO BE SHORTENED.

**WARNING**
If you are not familiar with motorcycle maintenance work, have a Yamaha dealer do it for you.

1. Owner’s tool kit

**Owner’s tool kit**
The owner’s tool kit is located behind panel A. (See page 6-7 for panel removal and installation procedures.) The service information included in this manual and the tools provided in the owner’s tool kit are intended to assist you in the performance of preventive maintenance and minor repairs. However, additional tools such as a torque wrench may be necessary to perform certain maintenance work correctly.
PERIODIC MAINTENANCE AND MINOR REPAIR

NOTE:
If you do not have the tools or experience required for a particular job, have a Yamaha dealer perform it for you.

WARNING
Modifications not approved by Yamaha may cause loss of performance and render the vehicle unsafe for use. Consult a Yamaha dealer before attempting any changes.
**PERIODIC MAINTENANCE AND MINOR REPAIR**

**Periodic maintenance and lubrication chart**

**NOTE:**
- The annual checks must be performed every year, except if a kilometer-based maintenance is performed instead.
- From 50,000 km, repeat the maintenance intervals starting from 10,000 km.
- Items marked with an asterisk should be performed by a Yamaha dealer as they require special tools, data and technical skills.

**NOTE:**
- The air filter needs more frequent service if you are riding in unusually wet or dusty areas.
- Hydraulic brake service
  - Regularly check and, if necessary, correct the brake fluid level.
  - Every two years replace the internal components of the brake master cylinders and calipers, and change the brake fluid.
  - Replace the brake hoses every four years and if cracked or damaged.
Removing and installing the cowling and panels

The cowling and panels shown above need to be removed to perform some of the maintenance jobs described in this chapter.

Refer to this section each time the cowling or a panel needs to be removed and installed.
PERIODIC MAINTENANCE AND MINOR REPAIR

Cowling A
To remove the cowling
Remove the screw, and then pull the cowling off as shown.

To install the cowling
Place the cowling in the original position, and then install the screw.

Panels A and B
To remove one of the panels
Remove the screw, and then pull the panel off as shown.

To install the panel
Place the panel in the original position, and then install the screw.
PERIODIC MAINTENANCE AND MINOR REPAIR

Checking the spark plug

The spark plug is an important engine component, which is easy to check. Since heat and deposits will cause any spark plug to slowly erode, the spark plug should be removed and checked in accordance with the periodic maintenance and lubrication chart. In addition, the condition of the spark plug can reveal the condition of the engine.

To remove the spark plug

1. Remove the spark plug cap.
2. Remove the spark plug as shown, with the spark plug wrench included in the owner's tool kit.
PERIODIC MAINTENANCE AND MINOR REPAIR

To check the spark plug
1. Check that the porcelain insulator around the center electrode of the spark plug is a medium-to-light tan (the ideal color when the motorcycle is ridden normally).

NOTE: If the spark plug shows a distinctly different color, the engine could be defective. Do not attempt to diagnose such problems yourself. Instead, have a Yamaha dealer check the motorcycle.

2. Check the spark plug for electrode erosion and excessive carbon or other deposits, and replace it if necessary.

Specified spark plug: DPR8EA-9 or DPR9EA-9 (NGK)

To install the spark plug
1. Measure the spark plug gap with a wire thickness gauge and, if necessary, adjust the gap to specification.

<table>
<thead>
<tr>
<th>Spark plug gap:</th>
<th>0.8–0.9 mm</th>
</tr>
</thead>
</table>

2. Clean the surface of the spark plug gasket and its mating surface, and then wipe off any grime from the spark plug threads.

3. Install the spark plug with the spark plug wrench, and then tighten it to the specified torque.

<table>
<thead>
<tr>
<th>Tightening torque:</th>
<th>Spark plug:</th>
</tr>
</thead>
<tbody>
<tr>
<td>17.5 Nm (1.75 m·kgf)</td>
<td></td>
</tr>
</tbody>
</table>

NOTE: If a torque wrench is not available when installing a spark plug, a good estimate of the correct torque is 1/4-1/2 turn past finger tight. However, the spark plug should be tightened to the specified torque as soon as possible.

4. Install the spark plug cap.
Engine oil and oil filter element
The engine oil level should be checked before each ride. In addition, the oil must be changed and the oil filter element replaced at the intervals specified in the periodic maintenance and lubrication chart.

To check the engine oil level
1. Place the motorcycle on a level surface and hold it in an upright position.

NOTE: Make sure that the motorcycle is positioned straight up when checking the oil level. A slight tilt to the side can result in a false reading.

1. Oil filler cap
2. Maximum level mark
3. Minimum level mark

2. Remove the oil filler cap cover by removing the screw.
3. Start the engine, warm it up for at least 10 seconds, and then turn it off.
4. Wait a few minutes until the oil settles, remove the oil filler cap, wipe the dipstick clean, insert it back into the oil filler hole (without screwing it in), and then remove it again to check the oil level.

NOTE: The engine oil should be between the minimum and maximum level marks.
PERIODIC MAINTENANCE AND MINOR REPAIR

**CAUTION:**
Do not operate the motorcycle until you know that the engine oil level is sufficient.

**WARNING**
Never remove the engine oil tank cap after high-speed operation, otherwise hot engine oil could spout out and cause damage or injury. Always let the engine oil cool down sufficiently before removing the oil tank cap.

5. If the engine oil is below the minimum level mark, add sufficient oil of the recommended type to raise it to the correct level.

6. Install the oil filler cap and the oil filler cap cover.

To change the engine oil (with or without oil filter element replacement)

1. Start the engine, warm it up for several minutes, and then turn it off.
2. Place an oil pan under the engine to collect the used oil.
3. Remove the oil filler cap cover, the oil filler cap and the drain bolts to drain the oil from the crankcase and oil tank.

4. Check the washers for damage and replace them if necessary.

**NOTE:**
Skip steps 5–8 if the oil filter element is not being replaced.

5. Remove the oil filter element cover by removing the bolts.

**NOTE:**
The oil filter element cover is secured by two bolts and a drain bolt. First, remove the drain bolt to drain the oil filter element cavity.
PERIODIC MAINTENANCE AND MINOR REPAIR

6. Remove and replace the oil filter element.
7. Check the O-rings for damage and replace them if necessary.
8. Install the oil filter element cover by installing the bolts, then tightening them to the specified torques.

NOTE: Make sure that the O-ring is properly seated.

9. Install the engine oil drain bolts, and then tighten them to the specified torques.

Tightening torques:
- Engine oil drain bolt (crankcase): 30 Nm (3.0 m·kgf)
- Engine oil drain bolt (oil tank): 18 Nm (1.8 m·kgf)

10. Add the specified amount of the recommended engine oil, install and tighten the oil filler cap, and then install the oil filler cap cover.

Recommended engine oil:
- See page 8-1.

Oil quantity:
- Without oil filter element replacement: 2.7 L
- With oil filter element replacement: 2.8 L
- Total amount (dry engine): 3.3 L

CAUTION:
- In order to prevent clutch slippage (since the engine oil also lubricates the clutch), do not mix any chemical additives with the oil or use oils of grade “CD” or higher. In addition, do not use oils labeled “ENERGY CONSERVING II” or higher.
- Make sure that no foreign material enters the crankcase.
PERIODIC MAINTENANCE AND MINOR REPAIR

12. Start the engine, and then let it idle for several minutes while checking it for oil leakage. If oil is leaking, immediately turn the engine off and check for the cause.

13. Turn the engine off, and then check the oil level and correct it if necessary.

CAUTION: After changing the engine oil, be sure to check the oil pressure as described below.

11. Remove the air bleed screw, and then start the engine. If oil does not seep out of the hole after a few minutes, immediately stop the engine and have a Yamaha dealer check for the cause. If oil seeps out of the hole, turn the engine off and install the air bleed screw.

Cleaning the air filter element

The air filter element should be cleaned at the intervals specified in the periodic maintenance and lubrication chart. Clean the air filter element more frequently if you are riding in unusually wet or dusty areas.

1. Remove panel B. (See page 6-8 for panel removal and installation procedures.)

2. Remove the air filter case cover by removing the screws, and then pull the air filter element out.
3. Lightly tap the air filter element to remove most of the dust and dirt, and then blow the remaining dirt out with compressed air as shown. If the air filter element is damaged, replace it.

4. Insert the air filter element into the air filter case with the arrow mark on the top pointing inward.

5. Install the air filter case cover by installing the screws.

6. Install the panel.

---

**Adjusting the carburetor**

The carburetor is an important part of the engine and requires very sophisticated adjustment. Therefore, most carburetor adjustments should be left to a Yamaha dealer, who has the necessary professional knowledge and experience. The adjustment described in the following section, however, may be serviced by the owner as part of routine maintenance.

**CAUTION:**
- Make sure that the air filter element is properly seated in the air filter case.
- The engine should never be operated without the air filter element installed, otherwise the piston and/or cylinder may become excessively worn.

**CAUTION:**
The carburetor has been set and extensively tested at the Yamaha factory. Changing these settings without sufficient technical knowledge may result in poor performance or damage to the engine.
PERIODIC MAINTENANCE AND MINOR REPAIR

Adjusting the engine idling speed

The engine idling speed must be checked and, if necessary, adjusted as follows at the intervals specified in the periodic maintenance and lubrication chart.

1. Start the engine and warm it up for several minutes at 1,000–2,000 r/min while occasionally revving it to 4,000–5,000 r/min.

NOTE:
The engine is warm when it quickly responds to the throttle.

2. Check the engine idling speed and, if necessary, adjust it to specification by turning the throttle stop screw. To increase the engine idling speed, turn the screw in direction a. To decrease the engine idling speed, turn the screw in direction b.

Engine idling speed:
1,200–1,400 r/min
(Except for CH)
1,300–1,400 r/min
(For CH)

NOTE: If the specified idling speed cannot be obtained as described above, have a Yamaha dealer make the adjustment.
PERIODIC MAINTENANCE AND MINOR REPAIR

Adapting the throttle cable free play
The throttle cable free play should measure 3–5 mm at the throttle grip. Periodically check the throttle cable free play and, if necessary, have a Yamaha dealer adjust it.

Tires
To maximize the performance, durability, and safe operation of your motorcycle, note the following points regarding the specified tires.

Tire air pressure
The tire air pressure should be checked and, if necessary, adjusted before each ride.

**WARNING**

- The tire air pressure must be checked and adjusted on cold tires (i.e., when the temperature of the tires equals the ambient temperature).
- The tire air pressure must be adjusted in accordance with the riding speed and with the total weight of rider, passenger, cargo, and accessories approved for this model.

---

Because loading has an enormous impact on the handling, braking, performance and safety characteristics of your motorcycle, you should keep the following precautions in mind.

- NEVER OVERLOAD THE MOTORCYCLE! Operation of an overloaded motorcycle may result in tire damage, loss of control, or severe injury. Make sure that the total weight of rider, passenger, cargo, and accessories does not exceed the specified maximum load for the vehicle.
- Do not carry along loosely packed items, which can shift during a ride.
- Securely pack the heaviest items close to the center of the motorcycle and distribute the weight evenly on both sides.
- Adjust the suspension and tire air pressure with regard to the load.
- Check the tire condition and air pressure before each ride.

PERIODIC MAINTENANCE AND MINOR REPAIR

NOTE:
The tire tread depth limits may differ from country to country. Always comply with the local regulations.

Tire inspection
The tires must be checked before each ride. If the center tread depth reaches the specified limit, if the tire has a nail or glass fragments in it, or if the sidewall is cracked, have a Yamaha dealer replace the tire immediately.

Tire information
This motorcycle is equipped with tube tires.

WARNING

- The front and rear tires should be of the same make and design, otherwise the handling characteristics of the motorcycle cannot be guaranteed.
- After extensive tests, only the tires listed below have been approved for this model by Yamaha Motor Co., Ltd.
PERIODIC MAINTENANCE AND MINOR REPAIR

WARNING

- Have a Yamaha dealer replace excessively worn tires. Besides being illegal, operating the motorcycle with excessively worn tires decreases riding stability and can lead to loss of control.
- The replacement of all wheel- and brake-related parts, including the tires, should be left to a Yamaha dealer, who has the necessary professional knowledge and experience.
- It is not recommended to patch a punctured tube. If unavoidable, however, patch the tube very carefully and replace it as soon as possible with a high-quality product.

Spoke wheels

To maximize the performance, durability, and safe operation of your motorcycle, note the following points regarding the specified wheels.
- The wheel rims should be checked for cracks, bends or warpage, and the spokes for looseness or damage before each ride. If any damage is found, have a Yamaha dealer replace the wheel. Do not attempt even the smallest repair to the wheel. A deformed or cracked wheel must be replaced.
- The wheel should be balanced whenever either the tire or wheel has been changed or replaced. An unbalanced wheel can result in poor performance, adverse handling characteristics, and a shortened tire life.
- Ride at moderate speeds after changing a tire since the tire surface must first be “broken in” for it to develop its optimal characteristics.
PERIODIC MAINTENANCE AND MINOR REPAIR

Adjusting the clutch lever free play

The clutch lever free play should measure 10–15 mm as shown. Periodically check the clutch lever free play and, if necessary, adjust it as follows.

1. Loosen the locknut at the clutch lever.
2. To increase the clutch lever free play, turn the adjusting bolt in direction \( a \). To decrease the clutch lever free play, turn the adjusting bolt in direction \( b \).
3. If the specified clutch lever free play could be obtained as described above, tighten the locknut and skip the rest of the procedure, otherwise proceed as follows.
4. Fully turn the adjusting bolt at the clutch lever in direction \( a \) to loosen the clutch cable.
5. Loosen the locknut at the crankcase.
6. To increase the clutch lever free play, turn the adjusting nut in direction \( a \). To decrease the clutch lever free play, turn the adjusting nut in direction \( b \).
7. Tighten the locknut at the clutch lever and the crankcase.
PERIODIC MAINTENANCE AND MINOR REPAIR

Adjusting the brake lever free play

The brake lever free play should measure 2–5 mm as shown. Periodically check the brake lever free play and, if necessary, adjust it as follows.

1. Loosen the locknut at the brake lever.

2. To increase the brake lever free play, turn the adjusting bolt in direction (a). To decrease the brake lever free play, turn the adjusting bolt in direction (b).

3. Tighten the locknut.

**WARNING**

- After adjusting the brake lever free play, check the free play and make sure that the brake is working properly.
- A soft or spongy feeling in the brake lever can indicate the presence of air in the hydraulic system. If there is air in the hydraulic system, have a Yamaha dealer bleed the system before operating the motorcycle. Air in the hydraulic system will diminish the braking performance, which may result in loss of control and an accident.

After adjusting the brake lever free play, check the free play and make sure that the brake is working properly.

Adjusting the brake pedal position

The top of the brake pedal should be positioned approximately 12 mm below the top of the footrest as shown. Periodically check the brake pedal position and, if necessary, have a Yamaha dealer adjust it.
A soft or spongy feeling in the brake pedal can indicate the presence of air in the hydraulic system. If there is air in the hydraulic system, have a Yamaha dealer bleed the system before operating the motorcycle. Air in the hydraulic system will diminish the braking performance, which may result in loss of control and an accident.

**Adjusting the rear brake light switch**

The rear brake light switch, which is activated by the brake pedal, is properly adjusted when the brake light comes on just before braking takes effect. If necessary, adjust the brake light switch as follows.

- Turn the adjusting nut while holding the rear brake light switch in place.
- To make the brake light come on earlier, turn the adjusting nut in direction \(a\).
- To make the brake light come on later, turn the adjusting nut in direction \(b\).

**Checking the front and rear brake pads**

The front and rear brake pads must be checked for wear at the intervals specified in the periodic maintenance and lubrication chart.
PERIODIC MAINTENANCE AND MINOR REPAIR

Front brake pads
Each front brake pad is provided with wear indicator grooves, which allow you to check the brake pad wear without having to disassemble the brake. To check the brake pad wear, check the wear indicator grooves. If a brake pad has worn to the point that the wear indicator grooves have almost disappeared, have a Yamaha dealer replace the brake pads as a set.

Rear brake pads
The rear brake is provided with a check plug, which, if it is removed, allows you to check the brake pad wear without having to disassemble the brake. To check the brake pad wear, check the position of the wear indicator while applying the brake. If a brake pad has worn to the point that the wear indicator almost touches the brake disc, have a Yamaha dealer replace the brake pads as a set.

Checking the brake fluid level
Insufficient brake fluid may allow air to enter the brake system, possibly causing it to become ineffective. Before riding, check that the brake fluid is above the minimum level mark and replenish if necessary. A low brake fluid level may indicate worn brake pads and/or brake system leakage. If the brake level is low, be sure to check the brake pads for wear and the brake system for leakage.
Observe these precautions:

- When checking the fluid level, make sure that the top of the brake fluid reservoir is level.
- Use only the recommended quality brake fluid, otherwise the rubber seals may deteriorate, causing leakage and poor braking performance.
- As the brake pads wear, it is normal for the brake fluid level to gradually go down. However, if the brake fluid level goes down suddenly, have a Yamaha dealer check the cause.

Recommended brake fluid:
DOT 4

Changing the brake fluid

Have a Yamaha dealer change the brake fluid at the intervals specified in the NOTE after the periodic maintenance and lubrication chart. In addition, have the oil seals of the master cylinders and calipers as well as the brake hoses replaced at the intervals listed below or whenever they are damaged or leaking.

- Oil seals: Replace every two years.
- Brake hoses: Replace every four years.
PERIODIC MAINTENANCE AND MINOR REPAIR

Drive chain slack
The drive chain slack should be checked before each ride and adjusted if necessary.

To check the drive chain slack
1. Place the motorcycle on a level surface and hold it in an upright position.

NOTE:
When checking and adjusting the drive chain slack, the motorcycle should be positioned straight up and there should be no weight on it.

2. Shift the transmission into the neutral position.

3. Move the rear wheel by pushing the motorcycle to locate the tightest portion of the drive chain, and then measure the drive chain slack as shown.

Drive chain slack:
30–40 mm

4. If the drive chain slack is incorrect, adjust it as follows.

   1. Adjusting plate
   2. Axle nut
   3. Brake caliper bracket bolt

To adjust the drive chain slack
1. Loosen the axle nut and the brake caliper bracket bolt.
2. To tighten the drive chain, turn the adjusting plate on each side of the swingarm in direction a.
   To loosen the drive chain, turn the adjusting plate on each side of the swingarm in direction b, and then push the rear wheel forward.
NOTE: Make sure that both adjusting plates are in the same position for proper wheel alignment.

CAUTION: Improper drive chain slack will overload the engine as well as other vital parts of the motorcycle and can lead to chain slippage or breakage. To prevent this from occurring, keep the drive chain slack within the specified limits.

1. Clean the drive chain with kerosene and a small soft brush.

CAUTION: To prevent damaging the O-rings, do not clean the drive chain with steam cleaners, high-pressure washers or inappropriate solvents.

2. Wipe the drive chain dry.

3. Thoroughly lubricate the drive chain with a special O-ring chain lubricant.

CAUTION: Do not use engine oil or any other lubricants for the drive chain, as they may contain substances that could damage the O-rings.

Tightening torques:
Axle nut: 105 Nm (10.5 m·kgf)
Brake caliper bracket bolt: 48 Nm (4.8 m·kgf)

Lubricating the drive chain
The drive chain must be cleaned and lubricated at the intervals specified in the periodic maintenance and lubrication chart, otherwise it will quickly wear out, especially when riding in dusty or wet areas. Service the drive chain as follows.

1. Tighten the axle nut and the brake caliper bracket bolt to the specified torques.
Checking and lubricating the cables

The operation of all control cables and the condition of the cables should be checked before each ride, and the cables and cable ends should be lubricated if necessary. If a cable is damaged or does not move smoothly, have a Yamaha dealer check or replace it.

Recommended lubricant:
Engine oil

Checking and lubricating the throttle grip and cable

The operation of the throttle grip should be checked before each ride. In addition, the cable should be lubricated or replaced at the intervals specified in the periodic maintenance chart.

⚠️ WARNING ⚠️
Damage to the outer sheath may interfere with proper cable operation and will cause the inner cable to rust. Replace a damaged cable as soon as possible to prevent unsafe conditions.
PERIODIC MAINTENANCE AND MINOR REPAIR

Checking and lubricating the brake and shift pedals
The operation of the brake and shift pedals should be checked before each ride, and the pedal pivot should be lubricated if necessary.

Recommended lubricant:
Lithium-soap-based grease (all-purpose grease)

Checking and lubricating the brake and clutch levers
The operation of the brake and clutch levers should be checked before each ride, and the lever pivot should be lubricated if necessary.

Recommended lubricant:
Lithium-soap-based grease (all-purpose grease)

Checking and lubricating the sidestand
The operation of the sidestand should be checked before each ride, and the sidestand pivot and metal-to-metal contact surfaces should be lubricated if necessary.

**WARNING**
If the sidestand does not move up and down smoothly, have a Yamaha dealer check or repair it.

Recommended lubricant:
Lithium-soap-based grease (all-purpose grease)
PERIODIC MAINTENANCE AND MINOR REPAIR

Lubricating the rear suspension
The pivoting points of the rear suspension must be lubricated at the intervals specified in the periodic maintenance and lubrication chart.

To check the operation
1. Place the motorcycle on a level surface and hold it in an upright position.
2. While applying the front brake, push down hard on the handlebars several times to check if the front fork compresses and rebounds smoothly.

CAUTION:
If any damage is found or the front fork does not operate smoothly, have a Yamaha dealer check or repair it.

1. Grease nipple (×2)

Checking the front fork
The condition and operation of the front fork must be checked as follows at the intervals specified in the periodic maintenance and lubrication chart.

To check the condition

WARNING
Securely support the motorcycle so that there is no danger of it falling over.

To check the operation
1. Place the motorcycle on a level surface and hold it in an upright position.
2. While applying the front brake, push down hard on the handlebars several times to check if the front fork compresses and rebounds smoothly.

CAUTION:
If any damage is found or the front fork does not operate smoothly, have a Yamaha dealer check or repair it.

Recommended lubricant:
Molybdenum disulfide grease
Checking the steering
Worn or loose steering bearings may cause danger. Therefore, the operation of the steering must be checked as follows at the intervals specified in the periodic maintenance and lubrication chart.

1. Place a stand under the engine to raise the front wheel off the ground.

⚠️ WARNING

Securely support the motorcycle so that there is no danger of it falling over.

2. Hold the lower ends of the front fork legs and try to move them forward and backward. If any free play can be felt, have a Yamaha dealer check or repair the steering.

Checking the wheel bearings
The front and rear wheel bearings must be checked at the intervals specified in the periodic maintenance and lubrication chart. If there is play in the wheel hub or if the wheel does not turn smoothly, have a Yamaha dealer check the wheel bearings.
PERIODIC MAINTENANCE AND MINOR REPAIR

Battery

This motorcycle is equipped with a sealed-type (MF) battery, which does not require any maintenance. There is no need to check the electrolyte or to add distilled water.

**CAUTION:**

Never attempt to remove the battery cell seals, as this would permanently damage the battery.

**WARNING**

- Electrolyte is poisonous and dangerous since it contains sulfuric acid, which causes severe burns. Avoid any contact with skin, eyes or clothing and always shield your eyes when working near batteries. In case of contact, administer the following FIRST AID.
  - **EXTERNAL:** Flush with plenty of water.
  - **INTERNAL:** Drink large quantities of water or milk and immediately call a physician.
  - **EYES:** Flush with water for 15 minutes and seek prompt medical attention.

- Batteries produce explosive hydrogen gas. Therefore, keep sparks, flames, cigarettes, etc., away from the battery and provide sufficient ventilation when charging it in an enclosed space.

**KEEP THIS AND ALL BATTERIES OUT OF THE REACH OF CHILDREN.**
PERIODIC MAINTENANCE AND MINOR REPAIR

To charge the battery
Have a Yamaha dealer charge the battery as soon as possible if it seems to have discharged. Keep in mind that the battery tends to discharge more quickly if the motorcycle is equipped with optional electrical accessories.

To store the battery
1. If the motorcycle will not be used for more than one month, remove the battery, fully charge it, and then place it in a cool, dry place.
2. If the battery will be stored for more than two months, check it at least once a month and fully charge it if necessary.
3. Fully charge the battery before installation.
4. After installation, make sure that the battery leads are properly connected to the battery terminals.

CAUTION:

- Always keep the battery charged. Storing a discharged battery can cause permanent battery damage.
- To charge a sealed-type (MF) battery, a special (constant-voltage) battery charger is required. Using a conventional battery charger will damage the battery. If you do not have access to a sealed-type (MF) battery charger, have a Yamaha dealer charge your battery.

Replacing the fuse
The fuse holder is located behind panel A. (See page 6-7 for panel removal and installation procedures.) If the fuse is blown, replace it as follows.

1. Turn the key to “OFF” and turn off all electrical circuits.
2. Remove the blown fuse, and then install a new fuse of the specified amperage.

Specified fuse:
20 A
CAUTION: Do not use a fuse of a higher amperage rating than recommended to avoid causing extensive damage to the electrical system and possibly a fire.

3. Turn the key to “ON” and turn on the electrical circuits to check if the devices operate.
4. If the fuse immediately blows again, have a Yamaha dealer check the electrical system.

Replacing the headlight bulb
This motorcycle is equipped with a quartz bulb headlight. If the headlight bulb burns out, replace it as follows.
1. Remove cowling A. (See page 6-7 for cowling removal and installation procedures.)
2. Remove the headlight unit by removing the bolts.
3. Disconnect the headlight coupler and the auxiliary light leads, and then remove the headlight bulb cover.
PERIODIC MAINTENANCE AND MINOR REPAIR

1. Headlight bulb holder

4. Remove the headlight bulb holder by turning it counterclockwise, and then remove the defective bulb.

**WARNING**
Headlight bulbs get very hot. Therefore, keep flammable products away from a lit headlight bulb, and do not touch the bulb until it has cooled down.

5. Place a new bulb into position, and then secure it with the bulb holder.

**CAUTION:**
Do not touch the glass part of the headlight bulb to keep it free from oil, otherwise the transparency of the glass, the luminosity of the bulb, and the bulb life will be adversely affected. Thoroughly clean off any dirt and fingerprints on the headlight bulb using a cloth moistened with alcohol or thinner.

6. Install the bulb cover, and then connect the coupler and leads.

7. Install the headlight unit by installing the bolts.

8. Install the cowling.

9. Have a Yamaha dealer adjust the headlight beam if necessary.

2. Remove the defective bulb by pushing it in and turning it counterclockwise.

3. Insert a new bulb into the socket, push it in, and then turn it clockwise until it stops.

4. Install the lens by installing the screws.

**CAUTION:**

Do not overtighten the screws, otherwise the lens may break.

---

**Supporting the motorcycle**

Since this model is not equipped with a centerstand, follow these precautions when removing the front and rear wheel or performing other maintenance requiring the motorcycle to stand upright. Check that the motorcycle is in a stable and level position before starting any maintenance. A strong wooden box can be placed under the engine for added stability.

**To service the rear wheel**

1. Stabilize the rear of the motorcy- cle by using a motorcycle stand or, if an additional motorcycle stand is not available, by placing a jack under the frame in front of the rear wheel.

2. Raise the front wheel off the ground by using a motorcycle stand.

Troubleshooting

Although Yamaha motorcycles receive a thorough inspection before shipment from the factory, trouble may occur during operation. Any problem in the fuel, compression, or ignition systems, for example, can cause poor starting and loss of power.

The following troubleshooting chart represents a quick and easy procedure for checking these vital systems yourself. However, should your motorcycle require any repair, take it to a Yamaha dealer, whose skilled technicians have the necessary tools, experience, and know-how to service the motorcycle properly.

Use only genuine Yamaha replacement parts. Imitation parts may look like Yamaha parts, but they are often inferior, have a shorter service life and can lead to expensive repair bills.

Tightening torque:

- Axle nut: 105 Nm (10.5 m·kgf)
- Brake caliper bracket bolt: 48 Nm (4.8 m·kgf)
- Swingarm end bolt: 2.5 Nm (0.25 m·kgf)

⚠️ WARNING

Keep away open flames and do not smoke while checking or working on the fuel system.

1. Fuel

- Check if there is fuel in the fuel tank.
  - Enough fuel: Go to compression check.
  - No fuel: Supply fuel. Engine doesn't start, go to compression check.

2. Compression

- Use electric starter.
  - There is compression: Go to ignition check.
  - No compression: Ask a Yamaha dealer to inspect.

3. Ignition

- Remove spark plug and check electrodes.
  - Wet: Wipe clean with dry cloth and correct spark gap or replace spark plug.
  - Dry: Ask a Yamaha dealer to inspect.
  - Open throttle half-way and start the engine.
  - Engine doesn't start: Go to compression check.

4. Battery

- Use the electric starter.
  - Engine turns over quickly: Battery good.
  - Engine turns over slowly: Check connections or recharge.
  - Engine doesn't start: ask a Yamaha dealer to inspect.
MOTORCYCLE CARE AND STORAGE

Care
While the open design of a motorcycle reveals the attractiveness of the technology, it also makes it more vulnerable. Rust and corrosion can develop even if high-quality components are used. A rusty exhaust pipe may go unnoticed on a car, however, it detracts from the overall appearance of a motorcycle. Frequent and proper care does not only comply with the terms of the warranty, but it will also keep your motorcycle looking good, extend its life and optimize its performance.

Before cleaning
1. Cover the muffler outlet with a plastic bag after the engine has cooled down.
2. Make sure that all caps and covers as well as all electrical couplers and connectors, including the spark plug cap, are tightly installed.
3. Remove extremely stubborn dirt, like oil burnt onto the crankcase, with a degreasing agent and a brush, but never apply such products onto seals, gaskets, sprockets, the drive chain and wheel axles. Always rinse the dirt and degreaser off with water.

Cleaning

CAUTION:

- Avoid using strong acidic wheel cleaners, especially on spoked wheels. If such products are used on hard-to-remove dirt, do not leave the cleaner on the affected area any longer than instructed. Also, thoroughly rinse the area off with water, immediately dry it, and then apply a corrosion protection spray.
- Improper cleaning can damage windshields, cowlings, panels and other plastic parts. Use only a soft, clean cloth or sponge with mild detergent and water to clean plastic.
MOTORCYCLE CARE AND STORAGE

- Do not use any harsh chemical products on plastic parts. Be sure to avoid using cloths or sponges which have been in contact with strong or abrasive cleaning products, solvent or thinner, fuel (gasoline), rust removers or inhibitors, brake fluid, antifreeze or electrolyte.

- Do not use high-pressure washers or steam-jet cleaners since they cause water seepage and deterioration in the following areas: seals (of wheel and swingarm bearings, fork and brakes), electric components (couplers, connectors, instruments, switches and lights), breather hoses and vents.

- For motorcycles equipped with a windshield: Do not use strong cleaners or hard sponges as they will cause dulling or scratching. Some cleaning compounds for plastic may leave scratches on the windshield. Test the product on a small hidden part of the windshield to make sure that it does not leave any marks. If the windshield is scratched, use a quality plastic polishing compound after washing.

After normal use

Remove dirt with warm water, a mild detergent, and a soft, clean sponge, and then rinse thoroughly with clean water. Use a toothbrush or bottle-brush for hard-to-reach areas. Stubborn dirt and insects will come off more easily if the area is covered with a wet cloth for a few minutes before cleaning.

After riding in the rain, near the sea or on salt-sprayed roads

Since sea salt or salt sprayed on roads during winter are extremely corrosive in combination with water, carry out the following steps after each ride in the rain, near the sea or on salt-sprayed roads.

NOTE: Salt sprayed on roads in the winter may remain well into spring.

1. Clean the motorcycle with cold water and a mild detergent, after the engine has cooled down.

CAUTION: Do not use warm water since it increases the corrosive action of the salt.

2. Apply a corrosion protection spray on all metal, including chrome- and nickel-plated, surfaces to prevent corrosion.
MOTORCYCLE CARE AND STORAGE

After cleaning
1. Dry the motorcycle with a chamois or an absorbing cloth.
2. Immediately dry the drive chain and lubricate it to prevent it from rusting.
3. Use a chrome polish to shine chrome, aluminum and stainless-steel parts, including the exhaust system. (Even the thermally induced discoloring of stainless-steel exhaust systems can be removed through polishing.)
4. To prevent corrosion, it is recommended to apply a corrosion protection spray on all metal, including chrome- and nickel-plated, surfaces.
5. Use spray oil as a universal cleaner to remove any remaining dirt.
6. Touch up minor paint damage caused by stones, etc.
7. Wax all painted surfaces.
8. Let the motorcycle dry completely before storing or covering it.

**WARNING**
- Make sure that there is no oil or wax on the brakes or tires. If necessary, clean the brake discs and brake linings with a regular brake disc cleaner or acetone, and wash the tires with warm water and a mild detergent.
- Before operating the motorcycle test its braking performance and cornering behavior.

**CAUTION:**
- Apply spray oil and wax sparingly and make sure to wipe off any excess.
- Never apply oil or wax to any rubber and plastic parts, but treat them with a suitable care product.
- Avoid using abrasive polishing compounds as they will wear away the paint.

**NOTE:** Consult a Yamaha dealer for advice on what products to use.
MOTORCYCLE CARE AND STORAGE

Storage

Short-term
Always store your motorcycle in a cool, dry place and, if necessary, protect it against dust with a porous cover.

CAUTION:
- Storing the motorcycle in a poorly ventilated room or covering it with a tarp, while it is still wet, will allow water and humidity to seep in and cause rust.
- To prevent corrosion, avoid damp cellars, stables (because of the presence of ammonia) and areas where strong chemicals are stored.

Long-term
Before storing your motorcycle for several months:
1. Follow all the instructions in the "Care" section of this chapter.
2. For motorcycles equipped with a fuel cock that has an "OFF" position: Turn the fuel cock lever to "OFF".
3. Drain the carburetor float chamber by loosening the drain bolt; this will prevent fuel deposits from building up. Pour the drained fuel into the fuel tank.
4. Fill up the fuel tank and add fuel stabilizer (if available) to prevent the fuel tank from rusting and the fuel from deteriorating.
5. Perform the following steps to protect the cylinder, piston rings, etc. from corrosion.
   a. Remove the spark plug cap and spark plug.
   b. Pour a teaspoonful of engine oil into the spark plug bore.
   c. Install the spark plug cap onto the spark plug, and then place the spark plug on the cylinder head so that the electrodes are grounded. (This will limit sparking during the next step.)
   d. Turn the engine over several times with the starter. (This will coat the cylinder wall with oil.)
   e. Remove the spark plug cap from the spark plug, and then install the spark plug and the spark plug cap.

WARNING
To prevent damage or injury from sparking, make sure to ground the spark plug electrodes while turning the engine over.
6. Lubricate all control cables and the pivoting points of all levers and pedals as well as of the sidestand/centerstand.

7. Check and, if necessary, correct the tire air pressure, and then lift the motorcycle so that both of its wheels are off the ground. Alternatively, turn the wheels a little every month in order to prevent the tires from becoming degraded in one spot.

8. Cover the muffler outlet with a plastic bag to prevent moisture from entering it.

9. Remove the battery and fully charge it. Store it in a cool, dry place and charge it once a month. Do not store the battery in an excessively cold or warm place (less than 0 °C) or more than 30 °C). For more information on storing the battery, see page 6-32.

NOTE: ______________________
Make any necessary repairs before storing the motorcycle.
