Abstract

Purpose of the study: Performance management is a process of delivering sustained success to organizations by improving capabilities of individuals and teams. Organizational culture as a significant contextual factor in performance management is scarcely studied. The aim of this study is to expand the base of knowledge and empirically test the relationship between components of organizational culture and performance management practices. Research Methodology: The study adopted exploratory research to explore the impact. Primary data was collected through questionnaires from 60 employees in COMSATS Institute of Information Technology. The sample consists of both male and female faculty members. Regression and Correlation analysis was used for statistical analysis. Findings: Statistical results show that involvement is highly correlated with consistency and adaptability. Similarly, other dimensions of organizational culture have significantly positive relationship with the performance management practices. Implications: This research selected sample from few cities of Pakistan. Future studies could select other cities and compare results with city of selected sample. This research used random sampling procedure, which is the main limitation of this study. Future studies could use stratified random sampling procedure with more sample size. Practical implications: It is hoped that the findings of this study will assist the human resource managers, practitioners and strategy makers to better understand organizational performance practices. Value Added: The added value of this paper is to link theory and practice, and explore the organizational culture dimension impact on performance management practices. Few studies have conducted over the years under this perspective in the Pakistan. Key words: Performance Management, Organizational Culture, Involvement, consistency, adaptability.

Recent literature proved that management of human resource in company has become an increasingly important for firm performance and business vision achievement. Employees are considered as valuable assets to an organization, which require effective management of these employees in firms. A lot of research in organizational theory has focused on developed countries; 95 percent and whereas only 5 percent of the studies testing organizational theories are found to be done in developing countries (Farashahi et al., 2005) inspite of the highly dynamic environment. A number of scholars have questioned the applicability of western management practices in developing countries and since long time it has also been recognized that culture is a main source of difference in performance management practices (Daniels et al., 2004; Piercy et al., 2004). Many researchers (e.g., Denison, Haaland, & Goelzer in Yilmaz, 2008) have called to investigate the phenomenon of organizational culture in different cultural context particularly in non-western nations. Therefore the first purpose of this paper is to find out whether management models of organizational culture and performance management are applicable in the context of Pakistan, a developing country.

Although, many researchers had examined the link between organizational culture and performance (Ogbonna & Harris, 2000; Rousseau, 1990; Kotter & Heskett, 1992; Marcoulides & Heck, 1993). Not much research has been done on organizational culture as a contextual factor of performance management (Magee, 2002). Therefore the second purpose of this paper is to determine the relationship between components of organizational culture and performance management practices, a pervasive human resource development and management practice. This study is indented to fill these gaps.

Performance management practices as fundamental human resource management practice support the view that employees and managers benefit from the understanding of organizational culture as a contextual factor. For the present empirical analysis Denison theory of organizational culture is employed which focuses on four cultural traits involvement, consistency, adaptability, and mission as key determinants of business performance.

Literature Review

Organizational Culture

Having established that organizational culture comprises a range of complex social phenomena, it is not
surprising that scholars have identified corporate culture as a multi-layered construct which can be divided into layers according to these phenomena’s observability and accessibility. Organizational culture has been defined as patterns of shared values and beliefs over time which produces behavioral norms that are adopted in solving problems (Owens 1987; Schein, 1990). The organization’s internal environment is represented by its culture and is construed by the assumptions and beliefs of the managers and employees (Aycan et al., 1999). Organizational Culture manifested in beliefs and assumptions, values, attitudes and behaviors of its members is a valuable source of firm’s competitive advantage (Hall, 1993; Peteraf, 1993) since it shapes organizational procedures, unifies organizational capabilities into a cohesive whole, provides solutions to the problems faced by the organization, and, thereby, hindering or facilitating the organization’s achievement of its goals (Yilmaz, 2008).

**Performance Management**

“Performance management is a strategic and integrated approach to delivering sustained success to organizations by improving the performance of the people who work in them and by developing the capabilities of teams and individual contributors” (Armstrong and Baron, 1998). It supports the rationale that people and not capital provide organizations with a competitive advantage (Reynolds & Ablett, 1998). The purpose of performance management is to transform the raw potential of human resource into performance by removing intermediate barriers as well as motivating and rejuvenating the human resource (Kandula, 2006). Competitive capacity of organization can be increased by building strong people and effectively managing and developing people (Cabrera & Banache, 1999) which is in essence performance management.

**The Relationship Between Organizational Culture and Performance Management**

According to Kandula (2006) the key to good performance is a strong culture. He further maintains that due to difference in organizational culture, same strategies do not yield same results for two organizations in the same industry and in the same location. A positive and strong culture can make an average individual perform and achieve brilliantly whereas a negative and weak culture may demotivate an outstanding employee to underperform and end up with no achievement. Therefore organizational culture has an active and direct role in performance management. Murphy and Cleveland (1995) believe that research on culture will contribute to the understanding of performance management. Magee (2002) contends that without considering the impact of organizational culture, organizational practices such as performance management could be counterproductive because the two are interdependent and change in one will impact the other.

**Denison’s Framework of Organizational Culture**

Yilmaz (2008) states that:

Following Schien (1984) at the core of Denison’s model are the underlying beliefs and assumptions that represent the deepest levels of organizational culture. These fundamental assumptions provide the foundation from which (1) more surface-level cultural components such as values and observable artifacts – symbols, heroes, rituals, etc. – are derived, and (2) behavior and action spring (Denison, 2000). (p. 292)

In Denison’s model comparisons of organizations based on relatively more “surface-level” values and their manifest practices are made. Such values are deemed both more accessible than the assumptions and more reliable than the artifacts (Denison, 2000 in Yilmaz, 2008). Denison’s organizational culture model is based on four cultural traits involvement, consistency, adaptability, and mission that have been shown in the literature to have an influence on organizational performance (Denison, 1990; Denison & Mishra, 1995)

The four traits of organizational culture in Denison’s framework are as follows:

**Involvement:** Effective organizations empower their people, build their organizations around teams, and develop human capability at all levels (Becker, 1964; Lawler, 1996; Likert, 1961). Executives, managers, and employees are committed to their work and feel that they own a piece of the organization. People at all levels feel that they have at least some input into decisions that will affect their work and that their work is directly connected to the goals of the organization (Katzenberg, 1993; Spreitzer, 1995).

**Consistency:** Organizations also tend to be effective because they have “strong” cultures that are highly consistent, well coordinated, and well integrated (Davenport, 1993; Saffold, 1988). Behavior is rooted in a set of core values, and leaders and followers are skilled at reaching agreement even when there are diverse points of view (Block, 1991). This type of consistency is a powerful
source of stability and internal integration that results from a common mindset and a high degree of conformity (Senge, 1990).

Adaptability: Ironically, organizations that are well integrated are often the most difficult ones to change (Kanter, 1983). Internal integration and external adaptation can often be at odds. Adaptable organizations are driven by their customers, take risks and learn from their mistakes, and have capability and experience at creating change (Nadler, 1998; Senge, 1990). They are continuously changing the system so that they are improving the organizations’ collective abilities to provide value for their customers (Stalk, 1988).

Mission: Successful organizations have a clear sense of purpose and direction that defines organizational goals and strategic objectives and expresses a vision of how the organization will look in the future (Mintzberg, 1987; 1994; Ohmae, 1982; Hamel & Prahalad, 1994). When an organization’s underlying mission changes, changes also occur in other aspects of the organization’s culture.

Conceptual Model and Hypotheses

The research is mainly aimed to investigate the relationship between organizational culture and the practices of performance management. Denison’s model proposes that organizations with a higher combined measure of the four culture traits show higher levels of performance which itself is the result of performance management. Therefore the first hypothesis is

H1: Organizational Culture has a significantly positive relationship with performance management practices.

Denison’s theory states that each of the four major cultural traits promotes superior firm performance. Since performance management also results in superior performance, therefore we posit that

H2: Cultural traits of involvement, consistency, adaptability, and mission in organizations exert a significantly positive influence on performance management practices.

Figure-1. A conceptual model of organization culture and performance management practices.

Research Methodology

The study consists of exploratory research designed to determine if organizational culture is associated with performance management. Pilot testing of the study was carried out by collecting primary data with the help of questionnaire distributed to 60 employees in COMSATS Institute of Information Technology which included a mix of faculty members, staff members, section heads, and heads of departments. 42 usable responses were received back.

4.1 Measures

For the purpose of measuring organizational culture Denison (2000) Organizational Culture Survey instrument which uses 60 items on a five point Likert scale with anchors strongly disagree (=1) to strongly agree (=5) was used. This framework focuses on cultural traits of involvement, consistency, adaptability, and mission.

Performance Management practices include specifying which goals to achieve, allocating decision rights, and measuring and evaluating performance. An aggregate
measure of PM practices is developed which uses a 5-point Likert scale with anchors strongly disagree (=1) to strongly agree (=5) by combining the following components.

a. Clear and measurable goals based on scale CLRMSG by Verbeeten, (2008). Goal setting theory asserts that people with specific and challenging goals perform better than those with vague goals, such as “do your best”, specific easy goals or no goals at all. Thus, goal setting theory assumes that there is a direct relation between the definition of specific and measurable goals and performance

b. The performance measurement system instrument (labelled BROADPMS) is based upon the instrument by Cavalluzzo and Ittner (2004) captures the extent to which different types of results-oriented performance measures have been developed for the activities of the organization apart from financial measures. Other activities included in performance management practices are adapted from Khatri (2000)

c. Consultative Performance Appraisal

d. Training Effectiveness/Evaluation

e. Performance-based Compensation

Analysis of the Data

The Pearson correlation was used to reflect the degree of linear relationship between two variables and determines the strength of the linear relationship between the variables; whilst, One-Way ANOVA was employed to determine the significance of the relationship. Based on the confirmation of directionality shown in Table 1, sufficient evidence exists to accept hypothesis H1 that organizational culture is positively and strongly associated with performance management practices at a confidence level of 0.99. Table 2 also confirms that each of the four organizational cultural traits of involvement, consistency, adaptability and mission are positively and strongly associated with performance management practices at a confidence level of 0.99. Based on this there is sufficient evidence to accept hypothesis H2.

**. Correlation is significant at the 0.01 level (2-tailed).

Table 2 describes the correlation analysis of organizational culture traits to performance management practices. All the variables including involvement, consistency, adaptability and mission has significantly positive impact on Performance Management Practices (PMP). The value of involvement for PMP is 0.736 significant at r= 0.01%. The value for consistency is 0.837 (r= 0.01%) which shows the high significance of relations. While values for adaptability and mission are 0.767 and 0.815 both with r=0.01%. As all the values of organizational culture have significant positive impact of PMP so hypothesis H2 is acceptable that organizational culture has positive impact on PM Practices.

b. Dependent Variable: Performance Management Practice (PMP)

Conclusion

The research is mainly aimed to investigate the relationship between organizational culture and the practices of performance management. Results show that adaptability and mission has significant positive values in correlation for PMP. All the variables must be positive to get better results from PM Practices. Traditionally organizational culture and design of human resource management practices such as performance management have been studied independently for organizational success. The results of this study indicate that they are strongly associated with each other and should be complimentary (Magee, 2002). Moreover the western management models were also validated in the context of a developing country.

Overall, there is a strong view in the literature that organizational culture lead to increased organizational performance. However, studies on this relationship often differ as to the extent a practice is likely to be positively or negatively related to performance. Human resource management practices has been argued to affect organizational culture, and in turn lead to firm performance we need to be wary of arguing that current evidence proves this relationship. There could, and probably are, a number of other organizational elements that provide a link between HRM and firm performance. More studies regarding the
organizational culture and performance link need to be conducted before we can deduce this causality relationship. In saying this, organizational culture has been shown to be an important aspect of a firm, as it can, and does affect employee’s behaviours, motivation and values.

Organizational performance management system create career paths for employees as well as groupings of people who remain in the firm for a long enough time for a company culture to form. This outlook suggests that firms can implement such management practices that foster job security and internal career development in order to keep turnover low, and maintain those social phenomena that comprise organizational culture (values, beliefs, norms, assumptions) within the organization, and therefore forming a strong organizational culture.
