Research Outcomes
Telemedicine’s Impact on Healthcare Cost and Quality
April 2015

Over 40 years of research has yielded a wealth of data about the cost effectiveness and efficacy of many telemedicine applications. PubMed, a bibliographic database of medical research that is maintained by the National Library of Medicine, includes over 12,000 citations of published works related to telemedicine or telehealth. Over 2,000 evaluative studies related to telemedicine have been published in two journals devoted to telemedicine alone. The summaries that appear highlight the results from a few of the studies that have evaluated the cost effectiveness, quality of care and patient acceptance of telemedicine. In addition, leading, validated studies have been identified by many of the ATA Member Groups. These are summarized at the end of this paper.

COST EFFECTIVENESS OF TELEMEDICINE

Most of the peer-reviewed research about the cost effectiveness of telemedicine that is based on large sample sizes and follows sound scientific rigor are relatively new, many emerging in the past two years. These studies are consistent in finding that telemedicine saves the patients, providers, and payers money when compared with traditional approaches to providing care. Many of these studies assess the cost effectiveness of specific telemedicine applications.

Results From A Patient-Centered Medical Home Pilot At UPMC Health Plan Hold Lessons For Broader Adoption Of The Model
Cynthia Napier Rosenberg, Pamela Peele, Donna Keyser, Sandra McAnallen, and Diane Holder
The patient-centered medical home is a promising model for improving access to high-quality care for more Americans at lower cost. However, feasible pathways for achieving a transformation from current primary care practices to this new model have yet to be fully identified. We report on the experience of UPMC Health Plan—part of a large, integrated delivery and financing system headquartered in Pittsburgh, Pennsylvania—in its efforts to support primary care practices as they converted to patient-centered medical homes. From 2008 through 2010, sites participating in the UPMC pilot achieved lower medical and pharmacy costs; more efficient service delivery, such as lower hospital admissions and readmissions and less use of hospital emergency departments; and a 160 percent return on the plan’s investment when compared with nonparticipating sites. We suggest approaches that could spur the adoption and spread of the model, including that payers be offered incentives to enter into patient-centered medical home contracts with interested providers; that payers increase efforts to provide primary care practices with access to usable data on their patient populations; and that telehealth be instituted to connect care managers to patients and practices when in-person visits are not possible or necessary.

Costs For ‘Hospital At Home’ Patients Were 19 Percent Lower, With Equal Or Better Outcomes Compared To Similar Inpatients
Lesley Cryer, Scott B. Shannon, Melanie Van Amsterdam, and Bruce Leff
Health Affairs June 2012 31:61237-1243; doi:10.1377/hlthaff.2011.1132
Hospitals are the standard acute care venues in the United States, but hospital care is expensive and can pose health
threats for older people. Albuquerque, New Mexico–based Presbyterian Healthcare Services adapted the Hospital at Home® model developed by the Johns Hopkins University Schools of Medicine and Public Health to provide acute hospital–level care within patients’ homes. Patients show comparable or better clinical outcomes compared with similar inpatients, and they show higher satisfaction levels. Available to Medicare Advantage and Medicaid patients with common acute care diagnoses, this program achieved savings of 19 percent over costs for similar inpatients. These savings were predominantly derived from lower average length-of-stay and use of fewer lab and diagnostic tests compared with similar patients in hospital acute care. Hospital at Home advances the Triple Aim of clinical quality, affordability, and exceptional patient experience.

Treatment of chronically ill people constitutes nearly four-fifths of US health care spending, but it is hampered by a fragmented delivery system and discontinuities of care. We examined the impact of a care coordination approach called the Health Buddy Program, which integrates a telehealth tool with care management for chronically ill Medicare beneficiaries. We evaluated the program’s impact on spending for patients of two clinics in the US Northwest who were exposed to the intervention, and we compared their experience with that of matched controls. We found significant savings among patients who used the Health Buddy telehealth program, which was associated with spending reductions of approximately 7.7–13.3 percent ($312–$542) per person per quarter. These results suggest that carefully designed and implemented care management and telehealth programs can help reduce health care spending and that such programs merit continued attention by Medicare. Meanwhile, mortality differences in the treatment and control groups suggest that the intervention may have produced noticeable changes in health outcomes, but we leave it to future research to explore these effects fully.

The Value of Provider-to-Provider Telehealth Technologies Center for Information Technology Leadership Partners HealthCare System, Inc, 2007

This study examined several specific telemedicine applications and used a rigorous approach to define both costs and financial benefits to the nationwide implementation of each application.

- For the use of telemedicine to join EMERGENCY ROOMS - the cost to equip all US emergency departments with hybrid telehealth technologies could easily be covered by savings from a reduction in transfers between emergency departments. From a baseline of 2.2 million patients transported each year between emergency departments at a cost of $1.39 billion in transportation costs, hybrid technologies would avoid 850,000 transports with a cost savings of $537 million a year.

- For the use of telemedicine in CORRECTIONAL FACILITIES - Correctional facilities could cover their costs of hybrid telehealth equipment by savings from a reduction in transporting patients to emergency departments and to physician offices, and by avoiding the costs of the emergency department visit. From a baseline of 94,180 transports made annually from correctional facilities to emergency departments at a cost of $158 million in transportation and visit costs, hybrid technologies could avoid almost 40,000 transports with a cost savings of $60.3 million a year. Further, hybrid technologies could avoid visits to physician offices. From an annual baseline of 691,000 physician office visits at a cost of $1.29 billion for in-person physician office visits and transportation, hybrid technologies could avoid 6.87 million transports with a cost savings of $479 million.

- For the use of telemedicine in NURSING HOMES - the costs of implementing hybrid telehealth equipment in nursing homes could be covered by savings from a reduction in transferring residents to emergency departments and physician offices, and by avoiding the costs of the emergency department visit. From a baseline of 2.7 million transports made annually from nursing facilities to emergency departments at a cost of $3.62 billion in current transportation and emergency department visit costs, hybrid technologies could avoid 387,000 transports with a cost savings of $327 million. In addition, of the 10.1 million physician office visits made annually from nursing facilities at a cost of $1.29 billion for in-person physician office visits and transportation, hybrid technologies could avoid 6.87 million transports with a cost savings of $479 million.
The Veterans Health Administration (VHA) introduced a national home telehealth program, Care Coordination/Home Telehealth (CCHT), in 2003 to coordinate the care of veteran patients with chronic conditions and avoid their unnecessary admission to long-term institutional care. CCHT patients increased from 2,000 to 31,570 (1,500% growth) between 2003 and 2007. CCHT is now a routine noninstitutional care (NIC) service provided by VHA to support veteran patients with chronic conditions as they age. Routine analysis of data obtained for quality and performance purposes from a cohort of 17,025 CCHT patients shows the benefits of a 25% reduction in numbers of bed days of care, 19% reduction in numbers of hospital admissions, and mean satisfaction score rating of 86% after enrollment into the program. These results demonstrate a dramatic reduction in costs and an equally dramatic increase in quality.
data were converted to patient preference–based time trade-off utility values based on published literature. Costs of disease management were determined based on 2006 Medicare reimbursements. Costs per quality-adjusted life year gained by teledicine and ophthalmoscopy for ROP management were compared. One-way sensitivity analysis was performed on the following variables: discount rate (0%-7%), incidence of treatment-requiring ROP (1%-20%), sensitivity and specificity of ophthalmoscopic diagnosis (75%-100%), percentage of readable telemedicine images (75%-100%), and sensitivity and specificity of telemedicine diagnosis (75%-100%). RESULTS For infants with birth weight less than 1500 g using a 3% discount rate for costs and outcomes, the costs per quality-adjusted life year gained were $3193 with telemedicine and $5617 with standard ophthalmoscopy. Sensitivity analysis resulted in ranges of costs per quality-adjusted life year from $1235 to $18 898 for telemedicine and from $2171 to $27 215 for ophthalmoscopy. CONCLUSIONS Telemedicine is more cost-effective than standard ophthalmoscopy for ROP management. Both strategies are highly cost-effective compared with other health care interventions.

**TELEMEDICINE AND QUALITY OF CARE**

Scientific studies in this area indicate that the use of telemedicine for such applications as monitoring of chronic care patients or allowing specialists to provide care to patients over a large region care have resulted in significantly improved care. For most telemedicine applications, studies have shown that there is no difference in the ability of the provider to obtain clinical information, make an accurate diagnosis, and develop a treatment plan that produces the same desired clinical outcomes as compared to in-person care when used appropriately. Here are a few examples.

Self-management of diabetes is essential to reducing the risks of associated disabilities. But effective self-management is often short-lived. Peers can provide the kind of ongoing support that is needed for sustained self-management of diabetes. In this context, peers are nonprofessionals who have diabetes or close familiarity with its management. Key functions of effective peer support include assistance in daily management, social and emotional support, linkage to clinical care, and ongoing availability of support. Using these four functions as a template of peer support, project teams in Cameroon, South Africa, Thailand, and Uganda developed and then evaluated peer support interventions for adults with diabetes. Our initial assessment found improvements in symptom management, diet, blood pressure, body mass index, and blood sugar levels for many of those taking part in the programs. For policy makers, the broader message is that by emphasizing the four key peer support functions, diabetes management programs can be successfully introduced across varied cultural settings and within diverse health systems.

The Indian Health Service (IHS), a federal health system, cares for 2 million of the country’s 5.2 million American Indian and Alaska Native people. This system has increasingly focused on innovative uses of health information technology and telemedicine, as well as comprehensive, locally tailored prevention and disease management programs, to promote health equity in a population facing multiple health disparities. Important recent achievements include a reduction in the life-expectancy gap between American Indian and Alaska Native people and whites (from eight years to five years) and improved measures of diabetes control (including 20 percent and 10 percent reductions in the levels of low-density lipoprotein cholesterol and hemoglobin A1c, respectively).
However, disparities persist between American Indian and Alaska Native people and the overall US population. Continued innovation and increased funding are required to further improve health and achieve equity.

**Home-based telehealth: a review and meta analysis**

Department of Health Policy and Administration, The Pennsylvania State University, Pennsylvania 16802, USA. We conducted a systematic review to identify studies on the effect of home telehealth on clinical care outcomes. The search was restricted to peer-reviewed publications (published between 2001 and 2007) about studies conducted in home or residential settings. The search yielded 154 potential articles and dissertations. A total of 29 articles met the inclusion criteria and were included in a meta-analysis. The weighted mean effect size for the overall meta-analysis was 0.50, and the z-statistic was 3.0, indicating that telehealth had a moderate, positive and significant effect (P < or = 0.01) on clinical outcomes. Sub-analyses also indicated positive significant effects of telehealth for some disease categories (heart disease and psychiatric conditions), but not others (diabetes), patient populations and telehealth interventions. Overall, the meta-analysis indicated that telehealth positively affects clinical outcomes of care, even in different patient populations.

This study/article concluded that even “early research demonstrated that the psychiatric interview conducted over videoconferencing is reliable for diagnostic assessment and treatment recommendations.” In addition, a retrospective review of medical records comparing clinical outcomes of patients seen by [interactive TV] (IATV) and those in-person showed no significant difference found in the percentage of change in Global Assessment of Functioning (GAF) between the two groups suggesting clinical outcomes were not affected by the use of IATV.

**Young TL, Ireson C. Effectiveness of school-based telehealth care in urban and rural elementary schools. Pediatrics. 2003 Nov;112(5):1088-94.**

Telehealth technology was effective in delivering pediatric acute care to children in [these] schools. Pediatric providers, nurses, parents, and children reported primary care school-based telehealth as an acceptable alternative to traditional health care delivery systems.

**Leggett PF, Graham L , Steele K, Gilliland A, Stevenson M, O'Reilly D, Wootton R, and Taggart A  (Sep 2001) Telerheumatology: Diagnostic accuracy and acceptability to patient, specialist, and general practitioner. British Journal of General Practice 51(470) : 746-8.**

This study examines the diagnostic accuracy and acceptability of telemedicine in the field of rheumatology. One hundred patients had a telephone and televisual consultation and the results were compared with a face-to-face consultation. While the telephone consultations were often unsatisfactory, the televisual consultations were highly accurate (97%) and acceptable to patients, general practitioners, and specialists.

Patient self-care adherence, medications, health status, and satisfaction did not significantly differ between groups. Telenursing can reduce CHF hospitalizations and allow increased frequency of communication with patients.

In pediatric patients, a narrow-bandwidth telephonic stethoscope can accurately distinguish between functional and organic murmurs and thus can detect heart disease. Accuracy is greatest when the instrument is used by an experienced examiner with patients at least 5 years of age.
Ermer D.J., 1999. Child and adolescent telepsychiatry clinics. *Psych Services* Jul 29(7): 409-14. This study concluded that severely disturbed children can be adequately assessed and treated, the range of expressed emotion and the quality of clinical interaction appear similar in TelePsychiatry and [in-person] interactions, and children in crisis can be safely assessed and treated [via telepsychiatry].

Main purpose of the project was to facilitate mental health in the region with the use of telehealth technology – role of simplifying case management and prior authorization. Program instituted by the Northern Arizona Regional Behavioral Health Authority.

Comparison of outcomes of patients admitted to two small. One hospital received neurological services by telehealth, the other in-person. Neurological services were provided via Telemedicine. Comparing case-mix, process of management, and outcomes for all patients using ICD-10 codes with a final diagnosis of neurological condition there were no appreciable differences noted between the clinical outcomes and the length of stay between patients receiving services in-person and those who received services via telehealth.

This is a study of patients receiving care over a telemedicine network that linked three hospitals and an FQHC with six sites, a dental clinic, and patient homes. Outcomes from the disease management programs conducted over telemedicine for the diabetes group showed that the diabetes disease management program increased the number of diabetics who brought their blood sugar under control.

**PATIENT SATISFACTION WITH TELEMEDICINE**

Patient satisfaction with the use of telemedicine to access care and the use of telecommunications technologies to connect with specialists and other health care providers in order to meet unmet medical needs has consistently been very high. Degrees of satisfaction may vary slightly with the specialty accessed through telemedicine, but overall patients have responded well to its use. The source of satisfaction for most patients is the ability to see a specialist trained in the area most closely related to the patient’s condition, the feeling of getting personalized care from a provider who has the patient’s interest in mind, and the ability to communicate with the provider in a very personal and intimate manner over the telecommunications technologies. Examples appear below.

Patient satisfaction was examined in relation to patient age, gender, race, income, education, and insurance. Overall patient satisfaction was found to be 98.3%.

In this study, results indicated that “most consumers found that a video link with a psychiatrist moderately or greatly helped them in managing their treatment, with 98% of the preferring to be offered videoconferencing in combination with local services.”

This study indicated that satisfaction did not differ significantly between video and in-person consultations for incarcerated patients.

PEDiATRIC TELEHEALTH SIG

McConnochie K, Wood N, Kitzman H, Herendeen N, Roy J, Roghmann K, Telemedicine Reduces Absence Resulting From Illness in Urban Child Care: Evaluation of an Innovation, Pediatrics, 2005; 115:1273-1282 Early study showing a 63% reduction in absence from child care due to illness when a pediatric telemedicine service is introduced during the daytime at 3 urban child care centers.

McConnochie KM, Tan J, Wood NE, Herendeen NE, Kitzman HJ, Roy J, Roghmann KJ. Acute illness utilization patterns before and after telemedicine in childcare for inner-city children: a cohort study. Telemedicine journal and e-health 2007; 13(4):381-90. This article is for those health care analysts who like statistical analysis and the ability to project financial impact given best case/worst case scenarios. Telemedicine saves money by replacing ED visits with less costly teledem office visits even if utilization goes up. “To estimate the most likely impact on “cost” one would use the most likely estimate for impact on overall utilization of 1.26 more visits per child. With this scenario, to break even with Rochester-area reimbursement rates would require replacement of 0.19 ED visits per year per child.”

A larger study tracking the utilization patterns of urban and suburban children with telemedicine access in their school or child care center compared to a well matched control group without telemedicine access. “The mean age at utilization was 6.71 years, with 79% of all child-months being covered by Medicaid managed care. The overall utilization rate was 305.1 visits per 100 child-years. In multivariate analyses with adjustment for potential confounders, overall illness-related utilization rates (in-person or telemedicine visits per 100 child-years) for all sites were 23.5% greater for children with telemedicine access than for control children, but ED utilization was 22.2% less.” This is our Win Win Win article: you can overcome disparities in access to pediatric care for poor urban children, increase utilization for inner city kids to equal their suburban counterparts and save money by offsetting expensive ED visits for non-emergent conditions.

Telemedicine increased the quality of care delivered to children who are victims of sexual abuse. Increased quality of evidentiary exam (and evidence collection).

Telemedicine reduced the frequency of transferring pediatric patients from a community NICU to a regional facility.

Telemedicine assists in the resuscitations of hospitalized pediatric patients.

This is adult related: Telemedicine increases the local community’s perception of the quality of care delivered at their local hospital.

Rural hospitals are able to keep more pediatric patients (and keep revenue) with telemedicine.

Telemedicine can be used to care for children with special healthcare needs so that they are able to be seen and treated in their own local community.

Telemedicine can be used to keep some critically ill children in their local community and resulted in excellent care quality.
