FOREWORD

The aim of NZS 8134.3 is to facilitate quality and consistently safe health and disability services by identifying practices designed to reduce the rate of infections in the health and disability sector.

NZS 8134.3 is applicable to all health and disability services. The Standards are mandatory for those services that are subject to the Health and Disability Services (Safety) Act 2001. Other health and disability services, should consider adopting them as they promote current accepted good practice.

The benefits and desired outcome of implementing NZS 8134.3 are:

(a) Improved safety for consumers, staff, and visitors;
(b) Increased attention to the basic principles of infection control;
(c) Identifying a consistent and applicable infection control baseline for services.

This document is intended to be generic and address the basic principles and systems that are the foundation for effective infection control. It is not intended to be an infection control manual or educational tool.

NZS 8134.3 is to be read in conjunction with NZS 8134.0 Health and disability services (general) Standard, as this contains the definitions and audit framework information applicable across the health and disability suite.

WHAT CAN YOU BUY

NZS 8134.3 Health and disability services (infection prevention and control) Standards consists of this document plus:

(a) NZS 8134.3.1 – Infection control management
(b) NZS 8134.3.2 – Implementing the infection control programme
(c) NZS 8134.3.3 – Policies and procedures
(d) NZS 8134.3.4 – Education
(e) NZS 8134.3.5 – Surveillance, and
(f) NZS 8134.3.6 – Antimicrobial usage.

NZS 8134.3 comprises part of NZS 8134:2008 and may be purchased as a set, that is loose-leaf, four-hole punched, and shrink wrapped for insertion in a binder with room for NZS 8134.0 Health and disability services (general) Standard, NZS 8134.1 Health and disability services (core) Standards, and NZS 8134.2 Health and disability services (restraint minimisation and safe practice) Standards.

FOREWORD

The aim of NZS 8134.3 is to facilitate quality and consistently safe health and disability services by identifying practices designed to reduce the rate of infections in the health and disability sector.

NZS 8134.3 is applicable to all health and disability services. The Standards are mandatory for those services that are subject to the Health and Disability Services (Safety) Act 2001. Other health and disability services, should consider adopting them as they promote current accepted good practice.

The benefits and desired outcome of implementing NZS 8134.3 are:

(a) Improved safety for consumers, staff, and visitors;
(b) Increased attention to the basic principles of infection control;
(c) Identifying a consistent and applicable infection control baseline for services.

This document is intended to be generic and address the basic principles and systems that are the foundation for effective infection control. It is not intended to be an infection control manual or educational tool.

NZS 8134.3 Health and disability services (infection prevention and control) Standards includes referenced and related documents and guidelines along with the following Standards:

(a) NZS 8134.3.1 – Infection control management;
(b) NZS 8134.3.2 – Implementing the infection control programme;
(c) NZS 8134.3.3 – Policies and procedures;
(d) NZS 8134.3.4 – Education;
(e) NZS 8134.3.5 – Surveillance;
(f) NZS 8134.3.6 – Antimicrobial usage.

Each is to be read in conjunction with NZS 8134.0 Health and disability services (general) Standard, as this contains the definitions and audit framework information applicable across the health and disability suite.
Infection control management is a set of systems and structures which organisations should have in place to safeguard and improve the quality of care.

The lines of accountability define the relationships between management/governing body, quality/risk management, clinical governance body, infection control committee, and infection control team/personnel.

There is evidence of an assessment of the organisation’s needs for infection control that specifies requirements such as resources, job descriptions, and terms of reference.

Each organisation is unique. The content and detail of the programme should be appropriate to the size, complexity, and degree of risk associated with the services provided.

Priority is to be given to managing risk in relation to infection control and there is a process that clearly demonstrates this.

Relevant key stakeholders may include but are not limited to:

(a) Infection control specialists, physicians, and nurses;
(b) Clinical microbiologists;
(c) Service providers including clinical staff;
(d) Public Health Units of District Health Boards (DHBs);
(e) Quality Improvement Teams;
(f) Medical Officers of Health;
(g) Consumers.

The committee is a group that provides representation from relevant disciplines within the organisation and has overview of the infection control programme. For smaller organisations this committee could be part of an already established committee involved in quality or other activities.

This may include but is not limited to:

(a) Endorsing the infection control programme, associated policies, and procedures;
(b) Assisting in the implementation of the programme;
(c) Monitoring the progress of the infection control programme;
(d) Documenting the frequency of the review of the programme;
(e) Ensuring a process exists for timely reporting of notifiable diseases and notifiable outbreaks to the local Medical Officer of Health; and
(f) Any reporting requirements to other key stakeholders/interested parties.

There is a clear process for consultation and planning including infection control expertise for facility changes, including renovation and design of buildings and staffing changes, when a change in staff ratio, skill mix, or additional services will impact on infection control risk.

In rare situations (for example measles, avian influenza) exposed susceptible contacts will be absent from work on the advice of the service provider’s general practitioner, the occupational health service and/or public health services.

Visitors may be restricted from entering healthcare facilities.

Consumers may require a transfer to an appropriate specialist service to meet their needs.

3.2: IMPLEMENTING THE INFECTION CONTROL PROGRAMME
WHAKATINANA I TE HŌTAKA
WHAKATINA WHAKAPOKENGA
CONTENTS

Foreword ........................................................................................................................................................................... 5
Standard 2    Implementing the infection control programme ............................................................................. 7
FOREWORD

The aim of NZS 8134.3 is to facilitate quality and consistently safe health and disability services by identifying practices designed to reduce the rate of infections in the health and disability sector.

NZS 8134.3 is applicable to all health and disability services. The Standards are mandatory for those services that are subject to the Health and Disability Services (Safety) Act 2001. Other health and disability services, should consider adopting them as they promote current accepted good practice.

The benefits and desired outcome of implementing NZS 8134.3 are:

(a) Improved safety for consumers, staff, and visitors;
(b) Increased attention to the basic principles of infection control;
(c) Identifying a consistent and applicable infection control baseline for services.

This document is intended to be generic and address the basic principles and systems that are the foundation for effective infection control. It is not intended to be an infection control manual or educational tool.

NZS 8134.3 Health and disability services (infection prevention and control) Standards includes referenced and related documents and guidelines along with the following Standards:

(a) NZS 8134.3.1 – Infection control management;
(b) NZS 8134.3.2 – Implementing the infection control programme;
(c) NZS 8134.3.3 – Policies and procedures;
(d) NZS 8134.3.4 – Education;
(e) NZS 8134.3.5 – Surveillance;
(f) NZS 8134.3.6 – Antimicrobial usage.

Each is to be read in conjunction with NZS 8134.0 Health and disability services (general) Standard, as this contains the definitions and audit framework information applicable across the health and disability suite.
Staffing and other resources required to implement the infection control programme should take into account the size and complexity of the organisation and its served population, and should meet the expectations of accepted infection control practices.

G 2.1

These skills and expertise may be externally contracted.

The number of staff required is not based solely on inpatient bed numbers. For example, in large complex facilities, provision should be made for the needs of outpatient services, special care units (such as intensive care units and neonatal units), community-based health services, mental health and addiction services, and exceptionally vulnerable consumers such as those with compromised immunity.

Depending on the size and complexity of the service, infection control personnel should have access to adequate resources to enable them to achieve their responsibilities. This may include but is not limited to:

(a) Office space;
(b) Secure storage for records;
(c) Access to relevant information and resources such as at least one current infection control text, relevant journals, bibliographic databases, library, the internet, and infection control personnel;
(d) Dedicated time allocated to meet the needs of the programme;
(e) Sufficient administrative, information technology (IT), and audit staff.

G 2.2

This may include but is not limited to:

(a) Implementation of infection control policies and procedures;
(b) Education;
(c) Ensuring advice and information is available on infection control and prevention;
(d) Surveillance;
(e) Ensuring links to the organisation’s quality and risk management programmes are established and maintained;
(f) Reporting and making recommendations to the infection control committee/governing body/senior management on infection control and prevention.

G 2.4

Successful case finding, surveillance, and investigation of outbreaks are dependent on access to the consumer information management system. Infection control personnel should be able to access electronic data systems directly where these exist. Consumer confidentiality is maintained in line with current legislation, including the Privacy Act and Health Information Privacy Code.
IMPLEMENTING THE INFECTION CONTROL PROGRAMME
WHAKATINANA I TE HŌTAKA WHAKATINA WHAKAPOKENGA

Standard 2

There are adequate human, physical, and information resources to implement the infection control programme and meet the needs of the organisation.

Criteria

The criteria required to achieve this outcome shall include the organisation ensuring:

2.1 The infection control team/personnel and/or committee shall comprise, or have access to, persons with the range of skills, expertise, and resources necessary to achieve the requirements of this Standard.

2.2 The infection control team/personnel and/or committee shall facilitate implementation of the infection control programme.

2.3 The infection control team/personnel members shall receive continuing education in infection control and prevention.

2.4 The infection control team/personnel shall have access to records and diagnostic results of consumers.

FOREWORD

The aim of NZS 8134.3 is to facilitate quality and consistently safe health and disability services by identifying practices designed to reduce the rate of infections in the health and disability sector.

NZS 8134.3 is applicable to all health and disability services. The Standards are mandatory for those services that are subject to the Health and Disability Services (Safety) Act 2001. Other health and disability services, should consider adopting them as they promote current accepted good practice.

The benefits and desired outcome of implementing NZS 8134.3 are:

(a) Improved safety for consumers, staff, and visitors;
(b) Increased attention to the basic principles of infection control;
(c) Identifying a consistent and applicable infection control baseline for services.

This document is intended to be generic and address the basic principles and systems that are the foundation for effective infection control. It is not intended to be an infection control manual or educational tool.

NZS 8134.3 Health and disability services (infection prevention and control) Standards includes referenced and related documents and guidelines along with the following Standards:

(a) NZS 8134.3.1 – Infection control management;
(b) NZS 8134.3.2 – Implementing the infection control programme;
(c) NZS 8134.3.3 – Policies and procedures;
(d) NZS 8134.3.4 – Education;
(e) NZS 8134.3.5 – Surveillance;
(f) NZS 8134.3.6 – Antimicrobial usage.

Each is to be read in conjunction with NZS 8134.0 Health and disability services (general) Standard, as this contains the definitions and audit framework information applicable across the health and disability suite.
G 3.1  It is recommended that all policies and procedures should:
(a) Include written material relevant to the organisation;
(b) Reflect current accepted good practice and relevant legislative requirements;
(c) Have sufficient flexibility to respond to individual consumer/service needs;
(d) Be in a user-friendly format;
(e) Contain the appropriate level of technical information;
(f) Be readily accessible to all personnel;
(g) Be developed and reviewed regularly in consultation with relevant service providers; and
(h) Identify the links to other documentation within the organisation.

G 3.2 (a) Hand hygiene is a critical measure for reducing the transmission of infection. The timeliness of hand hygiene, technique, and appropriate products for the setting should be included in any hand hygiene policy or procedure;

G 3.2 (b) Standard precautions are designed to reduce the risk of acquiring and spreading infective organisms. Standard precautions should be used at all times. Standard precautions:
(a) Apply to all;
(b) Are designed to protect staff and consumers;
(c) Ensure that personal protective equipment is provided and used when in contact with blood, body fluids, secretions, excretions, mucous membranes, and non-intact skin;
(d) Are used at all times when transmission-based precautions may be required; and
(e) Include cough etiquette, which is important in the prevention of respiratory transmissible illnesses;

G 3.2 (c) Transmission-based precautions cover:
(a) The isolation precautions required to manage those people who are diagnosed with or suspected of having infectious diseases;
(b) The management of those pathogens with clinical significance, such as multi-resistant organisms; and
(c) Providing a protective environment for severely immunocompromised persons.

G 3.2 (d) The prevention of infection and management of personnel with infectious, communicable diseases and potential pathogens of clinical and public health significance, such as chickenpox, tuberculosis, multi-resistant organisms. The policies and procedures should include:
(a) Assessment;
(b) Placement;
(c) Immunisation; and
(d) Exposure management issues.

G 3.2 (e) See NZS 8134.3.6;

G 3.2 (f) Outbreak management/pandemic planning procedures should include information on the investigation and management of suspected or actual outbreaks;

G 3.2 (g) The method of cleaning, disinfection and sterilisation should meet AS/NZS 4815 and AS/NZS 4187;

G 3.2 (h) Single use items are manufactured for a single patient or a single episode. Reprocessing is at the organisations risk, as it may pose a risk to the consumer;

G 3.2 (i) The risk of airborne infection created by environmental disturbances to consumers during renovation and construction. Services should ensure design and function is consistent with infection control principles.

G 3.3 This consultation and input may include but is not limited to:
(a) Cleaning, disinfection, and sterilisation of reusable medical devices;
(b) Kitchen or catering;
(c) Environmental services, for example cleaning;
(d) Laundry;
(e) Waste;
(f) Clinical procedures;
(g) Pandemic planning;
(h) Occupational health (needlestick injuries and other blood and body fluid exposures, pre-employment, and ongoing screening as appropriate);
(i) Ventilation and air quality systems.
Standard 3  Documented policies and procedures for the prevention and control of infection reflect current accepted good practice and relevant legislative requirements and are readily available and are implemented in the organisation. These policies and procedures are practical, safe, and appropriate/suitable for the type of service provided.

Criteria  The criteria required to achieve this outcome shall include the organisation ensuring:

3.1  There are written policies and procedures for the prevention and control of infection which comply with relevant legislation and current accepted good practice.

3.2  Policies and procedures shall include but are not limited to:

   (a)  Hand hygiene;
   (b)  Standard precautions;
   (c)  Transmission-based precautions;
   (d)  Prevention and management of infection in service providers;
   (e)  Antimicrobial usage;
   (f)  Outbreak management;
   (g)  Cleaning, disinfection, sterilisation, and reprocessing of reusable medical devices (if applicable) and equipment;
   (h)  Single use items; and
   (i)  Renovations and construction.

3.3  Policies and procedures (whether or not developed by contracted services or in-house services) that may affect the transmission of infection shall clearly identify who is responsible for the policy development and implementation, and shall be consistent with infection control policies and principles. Processes shall be in place to ensure ongoing infection control team/personnel involvement.

The aim of NZS 8134.3 is to facilitate quality and consistently safe health and disability services by identifying practices designed to reduce the rate of infections in the health and disability sector.

NZS 8134.3 is applicable to all health and disability services. The Standards are mandatory for those services that are subject to the Health and Disability Services (Safety) Act 2001. Other health and disability services, should consider adopting them as they promote current accepted good practice.

The benefits and desired outcome of implementing NZS 8134.3 are:

(a) Improved safety for consumers, staff, and visitors;
(b) Increased attention to the basic principles of infection control;
(c) Identifying a consistent and applicable infection control baseline for services.

This document is intended to be generic and address the basic principles and systems that are the foundation for effective infection control. It is not intended to be an infection control manual or educational tool.

NZS 8134.3 Health and disability services (infection prevention and control) Standards includes referenced and related documents and guidelines along with the following Standards:

(a) NZS 8134.3.1 – Infection control management;
(b) NZS 8134.3.2 – Implementing the infection control programme;
(c) NZS 8134.3.3 – Policies and procedures;
(d) NZS 8134.3.4 – Education;
(e) NZS 8134.3.5 – Surveillance;
(f) NZS 8134.3.6 – Antimicrobial usage.

Each is to be read in conjunction with NZS 8134.0 Health and disability services (general) Standard, as this contains the definitions and audit framework information applicable across the health and disability suite.
G.4.2 This may include but is not limited to:

(a) Policies/guidelines and key infection control issues relevant to the service;
(b) How staff can access current infection control information;
(c) Hand hygiene;
(d) Standard and transmission-based precautions;
(e) Blood and body fluid exposure management;
(f) Outbreak identification and management;
(g) Prudent antimicrobial prescribing;
(h) Cleaning, disinfection, and sterilisation practices of medical devices and equipment;
(i) Practice in relation to single-use items; and
(j) Surveillance.

G.4.5 This may include information and/or education for relatives and visitors, for example, pamphlets on infectious diseases such as Methicillin-resistant Staphylococcus aureus (MRSA).
Standard 4  The organisation provides relevant education on infection control to all service providers, support staff, and consumers.

Criteria  The criteria required to achieve this outcome shall include the organisation ensuring:

4.1 Infection control education is provided by a suitably qualified person who maintains their knowledge of current practice.

4.2 All service providers and support staff receive orientation and ongoing education on infection control that is relevant to their practice within the service or organisation.

4.3 Infection control education is evaluated to ensure the content is pertinent to the scope of service and reflects current accepted good practice.

4.4 The content of infection control education sessions is documented and a record of attendance maintained.

4.5 Consumer education occurs in a manner that recognises and meets the communication method, style, and preference of the consumer. Where applicable a record of this education should be kept.

FOREWORD

The aim of NZS 8134.3 is to facilitate quality and consistently safe health and disability services by identifying practices designed to reduce the rate of infections in the health and disability sector.

NZS 8134.3 is applicable to all health and disability services. The Standards are mandatory for those services that are subject to the Health and Disability Services (Safety) Act 2001. Other health and disability services, should consider adopting them as they promote current accepted good practice.

The benefits and desired outcome of implementing NZS 8134.3 are:

(a) Improved safety for consumers, staff, and visitors;
(b) Increased attention to the basic principles of infection control;
(c) Identifying a consistent and applicable infection control baseline for services.

This document is intended to be generic and address the basic principles and systems that are the foundation for effective infection control. It is not intended to be an infection control manual or educational tool.

NZS 8134.3 Health and disability services (infection prevention and control) Standards includes referenced and related documents and guidelines along with the following Standards:

(a) NZS 8134.3.1 – Infection control management;
(b) NZS 8134.3.2 – Implementing the infection control programme;
(c) NZS 8134.3.3 – Policies and procedures;
(d) NZS 8134.3.4 – Education;
(e) NZS 8134.3.5 – Surveillance;
(f) NZS 8134.3.6 – Antimicrobial usage.

Each is to be read in conjunction with NZS 8134.0 Health and disability services (general) Standard, as this contains the definitions and audit framework information applicable across the health and disability suite.
G 5.1 Reference should be made to:
(a) Appendix A;
(b) The Ministry of Health mandatory hospital acquired blood stream infection surveillance programme; and
(c) The Institute of Environmental Science and Research Ltd (ESR) multi-drug resistant organism (MDRO) surveillance programme.

G 5.2 These should include but are not limited to:
(a) Multi-drug resistant organisms including:
   (i) Methicillin resistant *Staphylococcus aureus* (MRSA);
   (ii) Extended spectrum beta-lactamase producing enterobacteriaceae (ESBLs), and
   (iii) Vancomycin resistant *enterococci* (VRE);
(b) *Clostridium difficile*.

G 5.3 Effective surveillance requires the support and cooperation of clinicians, service providers, and management who provide clinical services in which there is a risk of acquiring infection.

G 5.4 Accurate information can only be obtained if all persons involved in surveillance have the same understanding of what is meant by certain terms. Therefore standardised definitions of infection events, indicators, and outcomes are used and these increase the likelihood that any observed changes or trends are real and not due to differences in interpretation of terms.

The definitions of infection events, indicators, and outcomes used should reflect the organisation's needs and outcomes/goals. These definitions will be different for different types of facilities (see table A1 in Appendix A). In general, facilities should use or adapt definitions developed and published by national, international, or other surveillance organisations.

G 5.6 The type(s) of surveillance chosen will vary according to the objectives of the surveillance programme (see table A1 in Appendix A). In general, the larger the facility or the greater the number of events detected, the more frequent should be the surveillance and the reporting of surveillance activities.

G 5.7 The findings, outcomes, and recommendations which follow surveillance activities should be recorded and tabled at the nearest timely meeting of the infection control committee. A summary should be lodged with senior management and recommended follow up should be acted upon and supported with documentation.
Standard 5  Surveillance for infection is carried out in accordance with agreed objectives, priorities, and methods that have been specified in the infection control programme.

Criteria  The criteria required to achieve this outcome shall include the organisation ensuring:

5.1  The organisation, through its infection control committee/infection control expert, determines the type of surveillance required and the frequency with which it is undertaken. This shall be appropriate to the size and complexity of the organisation.

5.2  Surveillance shall be conducted on multi-resistant organisms and organisms associated with antimicrobial use.

5.3  Senior management and all service providers shall take responsibility for surveillance activities and promote surveillance monitoring as one of the premier quality assurance programmes impacting on consumer safety.

5.4  Standardised definitions are used for the identification and classification of infection events, indicators, or outcomes.

5.5  The type of surveillance to be undertaken should be appropriate for the organisation, including:

(a)  Size;
(b)  Type of services provided;
(c)  Acuity, risk factors, and needs of the consumer;
(d)  Risk factors to service providers.

5.6  The surveillance methods, analyses, and assignment of responsibilities are described and documented.

5.7  Results of surveillance, conclusions, and specific recommendations to assist in achieving infection reduction and prevention outcomes are acted upon, evaluated, and reported to relevant personnel and management in a timely manner.

5.8  There is evidence of communication between services on consumers who develop infection.
APPENDIX A

SURVEILLANCE – ADDITIONAL INFORMATION

(Informative)

A1 Events under surveillance may be detected in a variety of ways. These may include but are not limited to, chart review, walk rounds, review of laboratory reports, medication or pharmacy records, or notification by medical staff. A surveillance programme should incorporate at least two different detection or case finding methods. If possible, one of these should entail active surveillance, where infection control personnel actively look for the events under surveillance such as on walk rounds, as opposed to passive surveillance where infection control personnel rely on others to report the events.

A2 For each type of infection event, indicator or outcome identified, the data collected should include basic consumer demographics and infection or outcome information as well as information on known consumer risk factors such as invasive devices or procedures. The frequency of data collection will depend on the type of surveillance, the event being monitored, and the size and type of the service or facility (see table A1).

A3 Data analysis may include but is not limited to a review of the quantity, frequency, source, site, and type of event. When identifying variations and trends in event occurrence, numbers of Infection events, indicators, and outcomes are not generally as useful as infection rates. Rates compensate for fluctuations in the size of the population under surveillance and are a more accurate reflection of what is occurring. The denominator used to calculate rates will be different for different kinds of surveillance and for different types of services or facilities (see table A1).

A4 Systematic surveillance refers to the regular collection, collation, and analysis of information on infection events and rates, either continuously or at regular intervals, and the timely dissemination and feedback of data. The projected use of the data shows how the data will be used to evaluate or assess infection control activities.

Surgical facilities should, as a basic minimum activity, undertake continuous surveillance of Staphylococcus aureus blood stream infections and conduct regular surveillance of wound infection rates following clean surgical procedures in joint replacement surgery and Caesarean sections.

FOREWORD

The aim of NZS 8134.3 is to facilitate quality and consistently safe health and disability services by identifying practices designed to reduce the rate of infections in the health and disability sector.

NZS 8134.3 is applicable to all health and disability services. The Standards are mandatory for those services that are subject to the Health and Disability Services (Safety) Act 2001. Other health and disability services, should consider adopting them as they promote current accepted good practice.

The benefits and desired outcome of implementing NZS 8134.3 are:

(a) Improved safety for consumers, staff, and visitors;
(b) Increased attention to the basic principles of infection control;
(c) Identifying a consistent and applicable infection control baseline for services.

This document is intended to be generic and address the basic principles and systems that are the foundation for effective infection control. It is not intended to be an infection control manual or educational tool.

NZS 8134.3 Health and disability services (infection prevention and control) Standards includes referenced and related documents and guidelines along with the following Standards:

(a) NZS 8134.3.1 – Infection control management;
(b) NZS 8134.3.2 – Implementing the infection control programme;
(c) NZS 8134.3.3 – Policies and procedures;
(d) NZS 8134.3.4 – Education;
(e) NZS 8134.3.5 – Surveillance;
(f) NZS 8134.3.6 – Antimicrobial usage.

Each is to be read in conjunction with NZS 8134.0 Health and disability services (general) Standard, as this contains the definitions and audit framework information applicable across the health and disability suite.
Antibiotic guidelines should:

(a) Be consistent with local resistance data;

(b) Discourage indiscriminate use of third and fourth generation Cephalosporins and older broad spectrum antibiotics;

(c) Have clear recommendations for dose, timing, and duration of surgical prophylaxis.
ANTIMICROBIAL USAGE
WHAKAMAHINGA ANTIMICROBIAL

Standard 6  Acute care and surgical hospitals will have established and implemented policies and procedures for the use of antibiotics to promote the appropriate prudent prescribing in line with accepted guidelines. The service can seek guidance from clinical microbiologists or infectious disease physicians.

For a residential home/unit or aged care service, it is the consumer’s individual GP who is responsible for guidance on the management of antibiotic use.

Criteria  The criteria required to achieve this outcome shall include the organisation ensuring:

6.1  The organisation, medical practitioner or other prescriber has an antimicrobial policy which is consistent with the current accepted practice of prudent use in the treatment of infections.

6.2  Where prophylactic antibiotics are prescribed, a policy/guideline exists for their appropriate use.

6.3  Evidence of good practice guideline use, or specialist advice on antimicrobial therapy and prophylaxis can be demonstrated.

6.4  Regular auditing and monitoring of compliance with prophylactic and therapeutic antimicrobial policies shall be a component of the facility’s infection control programme.

6.5  Information on the antimicrobial susceptibility patterns of significant clinical isolates should be fed back to the infection control team/personnel and prescriber by the local diagnostic laboratory.

* applies to acute, secondary or tertiary services only
